**SUBJECT: 0 Seely Avenue Mixed-Use Project, San Jose, CA –
Responses to Noise Comments**

This memo summarizes Illingworth & Rodkin, Inc.’s (I&R) responses to the noise-related comments made by Adams Broadwell Joesph & Cardozo dated March 11, 2024.

Comment C-3.6

The DEIR Fails to Properly Document Baseline Ambient Noise Measurements

Response C-3.6

The comment questions the accuracy of the ambient noise measurements made by I&R because technical details (e.g., sound level meter settings, microphone height, equipment specifications, calibration records, and the use of field calibrators) were not summarized in the noise and vibration assessment.

A field noise study was conducted following the recommended noise measurement procedures presented in the California Department of Transportation’s Technical Noise Supplement (TeNS Manual).¹ Per, the TeNS Manual Abstract, “This manual contains Caltrans noise analysis

¹ Caltrans. 2013. Technical Noise Supplement. September. Sacramento, CA: Environmental Program, Noise, Air Quality, and Hazardous Waste Management Office. Sacramento, CA.

procedures, practices, and other useful technical background information related to the analysis and reporting of highway and construction noise impacts and abatement. ...Except for some Caltrans-specific methods and procedures, most methods and procedures recommended in this document are in conformance with industry standards and practices. This document can be used as a stand-alone guide for highway noise training purposes or as a reference for technical concepts, methodology, and terminology needed to acquire a basic understanding of highway noise and construction noise-related issues.”

Noise measurements were made with Larson Davis Model 820 and LxT1 Integrating Sound Level Meters (SLMs) set at “slow” response. The SLMs were equipped with free field, prepolarized condenser microphones fitted with windscreens. The SLMs were calibrated prior to the noise measurements using a Larson Davis Model CAL200 acoustical calibrator. The response of the system was checked after each measurement session and was always found to be within 0.2 dBA. No calibration adjustments were made to the measured sound levels. The SLMs for the long-term noise measurements were secured to utility poles or trees at heights of 10-12 feet above the ground. The short-term noise measurements were made at a height of five feet above the ground. All instrumentation used during the noise survey met the requirements of the American National Standards Institute SI 4-1983 for Type I use. Calibration records of the equipment used during the noise survey are presented in Appendix A.

Comment C-3.15

The DEIR Fails to Account for Noise Impacts on New Sensitive Receptors as a Result of the Project

Response C-3.15

It is not customary to evaluate temporary construction noise on new sensitive receptors introduced during early phases of the project while the remaining phases of the project are completed. Early phase residents would be fully aware of the potential for annoyance due to temporary construction noise during later phases of the project, but this would not be considered a significant impact under CEQA. The applicable CEQA checklist question related to this comment is, “Would the project result in the generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?” The phrase, “in the vicinity of the project” means the area that is close to or around the project site, and does not mean the area encompassing the project site itself. Therefore, temporary construction noise was not evaluated at new sensitive receptors on the project site, but rather, the evaluation was limited to off-site receptors that were close to or around the project site following the CEQA guidance.

Comment C-3.16

Mitigation Measure NSE-1 Is Insufficient, and The DEIR Underestimates Construction Noise Levels, Further Undermining the Proposed Mitigation Measures

Response C-3.16

The intent of the measure requiring the construction of an eight-foot noise barrier along the northwest boundary of the site adjacent to residences was to reduce noise levels as much as reasonable outdoors where residents would be expected to congregate. The commenter agrees that an eight-foot noise barrier would achieve 5 dBA of noise reduction when the barrier effectively blocks the line of sight between the noise source and the receiver. This condition would occur when the noise source (i.e., heavy construction equipment) and receptor are located at the ground level. In the case of the credible worst-case noise levels predicted as part of the analysis, these noise level estimates assume the operation of the two loudest pieces of heavy construction equipment operating at the ground level. Heavy construction equipment would not operate at the upper floors of the Townhomes, Building A, or Building B. At the upper floors of these buildings, smaller and substantially less noisy tools would be used resulting in lower noise levels than those predicted in the noise and vibration assessment. The eight-foot temporary noise barriers were recommended to reduce noise levels at the ground floor of the adjacent residences, where residents may be expected to congregate outdoors. Other common outdoor activity areas of adjacent residential land uses are located in well shielded courtyards or within well shielded paseos that would only have a limited view of the construction site. While the eight-foot noise barriers would not reduce noise levels at the upper stories of the apartments facing the site, it was assumed that interior noise levels would be controlled by closing the windows.

With respect to the construction noise levels calculated as part of the noise and vibration assessment, both the noise levels from the “two loudest pieces of equipment per phase scenario” and the “all equipment per phase scenario” were calculated. The construction noise levels predicted under each of these scenarios were reviewed and compared, and were found to be within 0 to 1 dBA of each other in all cases but one. In the one case where noise levels varied, (i.e., the site preparation phase during the construction of project infrastructure), the difference in noise levels between the scenario involving the two loudest pieces of equipment per phase and all equipment per phase was up to 6 dBA (i.e., 84 dBA at 50 feet vs. 90 dBA at 50 feet). This unusual difference in predicted noise levels resulted because this phase would utilize up to 13 pieces of construction equipment. However, one cannot assume that all 13 pieces of construction equipment could physically operate at a distance of 50 feet from a receptor in such close proximity to one another. A more likely construction scenario is that the construction equipment during this particular phase is distributed throughout the entire site, thus leaving the noise from the closest construction equipment as the dominant noise source. The “two loudest pieces of equipment scenario” discussed above credibly represents construction noise levels emanating from the site and is a more accurate method for calculating construction noise levels based on observation at numerous construction sites.

Appendix A – Equipment Calibration Certificates

Certificate of Calibration and Conformance

Certificate Number 2020-209001

Instrument Model 820, Serial Number 1211, was calibrated on 14 Feb 2020. The instrument meets factory specifications per Procedure D0001.8160, ANSI S1.4 1983, IEC 651-Type 1 1979, and IEC 804-Type 1 1985.

Instrument found to be in calibration as received: NO

Date Calibrated: 14 Feb 2020

Calibration due: 14 Feb 2022

Calibration Standards Used

MANUFACTURER	MODEL	SERIAL NUMBER	INTERVAL	CAL. DUE	TRACEABILITY NO.
Larson Davis	LDSigGn/2209	0445 / 0111	12 Months	4 Dec 2020	2019-208848

Reference Standards are traceable to the National Institute of Standards and Technology (NIST)

Calibration Environmental Conditions

Temperature: 24 ° Centigrade

Relative Humidity: 18 %

Affirmations

This Certificate attests that this instrument has been calibrated under the stated conditions with Measurement and Test Equipment (M&TE) Standards traceable to the U.S. National Institute of Standards and Technology (NIST). All of the Measurement Standards have been calibrated to their manufacturers' specified accuracy / uncertainty. Evidence of traceability and accuracy is on file at Provo Engineering & Manufacturing Center. An acceptable accuracy ratio between the Standard(s) and the item calibrated has been maintained. This instrument meets or exceeds the manufacturer's published specification unless noted.

The collective uncertainty of the Measurement Standard used does not exceed 25% of the applicable tolerance for each characteristic calibrated unless otherwise noted.

The results documented in this certificate relate only to the item(s) calibrated or tested. A one year calibration is recommended, however calibration interval assignment and adjustment are the responsibility of the end user. This certificate may not be reproduced, except in full, without the written approval of the issuer.

See "AS RECEIVED" data.
Tested with PRM828-2846

Sound Level Meter Model: 820A Serial Number: A1211
Log Linearity, Differential Linearity and Range Data

This Type 1 Sound Level Meter (including attached PRM828 preamplifier and ADP005 18 pF input adapter) was calibrated with a reference 1kHz sine wave at a level of 114.0 dB SPL. The instrument's Log Linearity A-weighted slow response was then electrically tested using a 1kHz sine wave from 18.0 dB SPL to 138.0 dB SPL in 0.5 dB increments.

Plotted per typical sensitivity of a 2541 microphone; 44.5 mV/Pa & 17.1 pF.

Overload occurs at 129.9 dB SPL.

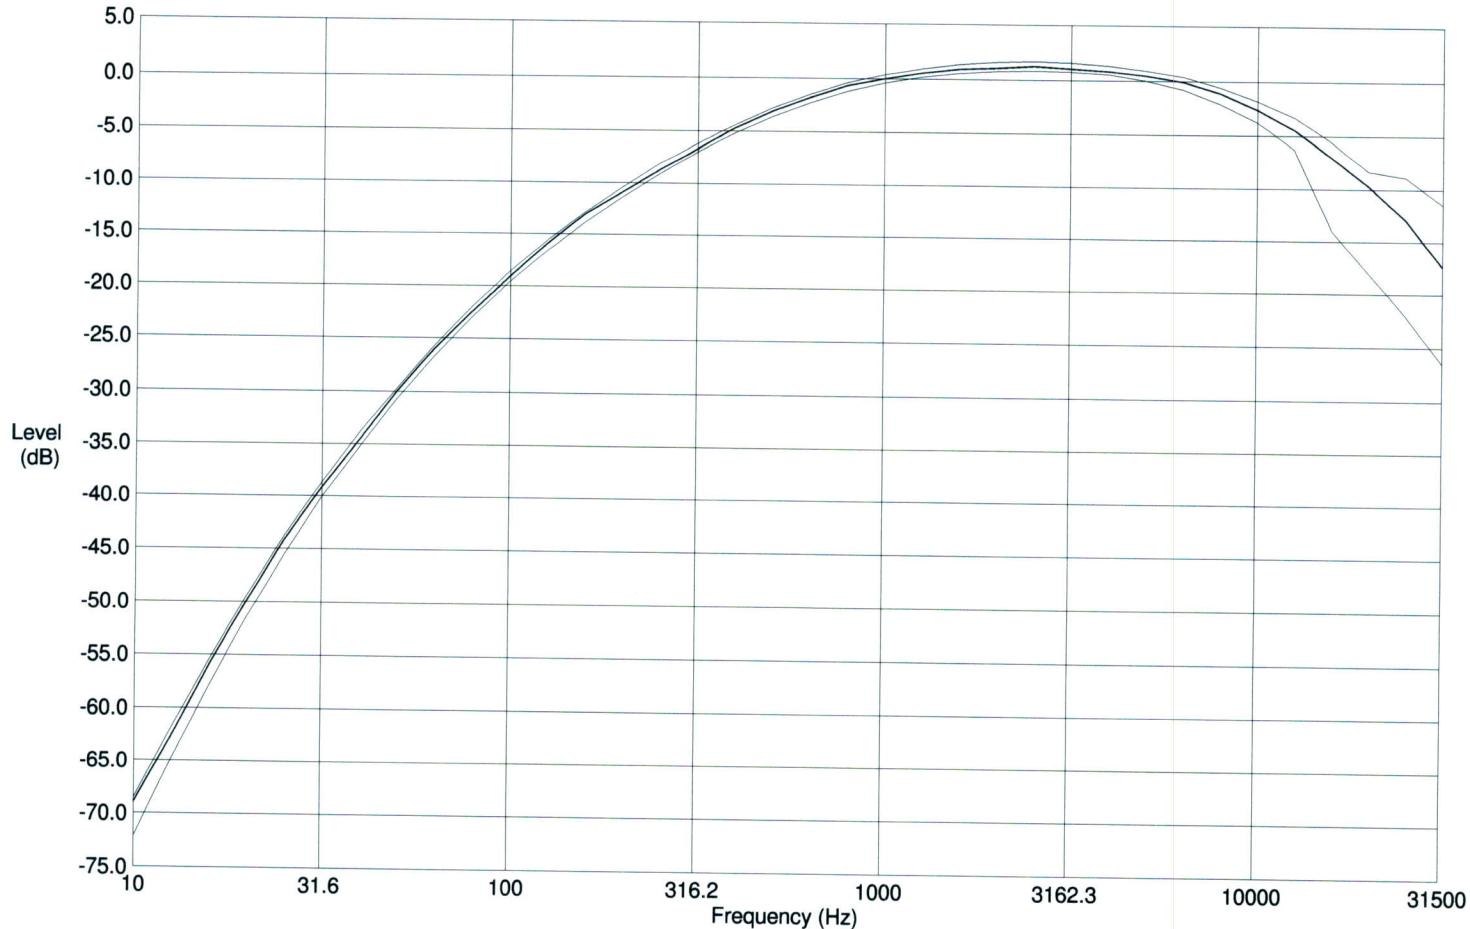

Primary indicator range: 103.3 dB (lower limit: 26.5 dB SPL to upper limit: 129.8 dB SPL).

Dynamic range: 111.5 dB (noise floor: 18.3 dB SPL to upper limit: 129.8 dB SPL).

This instrument is in compliance with IEC 60651 (2001-10) 7.9 and 7.10, ANSI S1.4-1983 3.2 and IEC 60804 (2001-10) 9.2.1 for Type 1 sound level meters when used with a Larson Davis Type 1 microphone.

Sound Level Meter Model: 820A Serial Number: A1211
Certificate of A-Weight Electrical Conformance

This Type 1 Sound Level Meter (including attached PRM828 preamplifier and ADP005 18 pF input adapter) was calibrated with a reference 1kHz sine wave at a level of 114.0 dB SPL. The instrument's A-weighted response was then electrically tested using a 2.0 Vrms sinewave at exact frequencies as specified in IEC 60651 (2001-10) and ANSI S1.4-1983.

This instrument is in compliance with IEC 60651 (2001-10) 6.1 and 9.2.2, ANSI S1.4-1983 5.1 and 8.2.1, and IEC 60804 (2001-10) 5.1 for Type 1 sound level meters when used with a Larson Davis Type 1 microphone.

Sound Level Meter Model: 820A Serial Number: A1211
Log Linearity, Differential Linearity and Range Data
****Failed**: (PrimIndRange)**

This Type 1 Sound Level Meter (including attached PRM828 preamplifier and ADP005 18 pF input adapter) was calibrated with a reference 1kHz sine wave at a level of 114.0 dB SPL. The instrument's Log Linearity A-weighted slow response was then electrically tested using a 1kHz sine wave from 18.0 dB SPL to 138.0 dB SPL in 0.5 dB increments.

Plotted per typical sensitivity of a 2541 microphone; 44.5 mV/Pa & 17.1 pF.

Overload occurs at 129.9 dB SPL.

Primary indicator range: 83.3 dB (lower limit: 46.5 dB SPL to upper limit: 129.8 dB SPL).

Dynamic range: 110.3 dB (noise floor: 19.5 dB SPL to upper limit: 129.8 dB SPL).

This instrument is NOT in compliance with IEC 60651 (2001-10) 7.9 and 7.10, ANSI S1.4-1983 3.2 and IEC 60804 (2001-10) 9.2.1 for Type 1 sound level meters when used with a Larson Davis Type 1 microphone.

Certificate of Calibration and Conformance

Certificate Number 2019-208875

Instrument Model 820, Serial Number 1375, was calibrated on 18 Dec 2019. The instrument meets factory specifications per Procedure D0001.8160, ANSI S1.4 1983, IEC 651-Type 1 1979, and IEC 804-Type 1 1985.

Instrument found to be in calibration as received: NO

Date Calibrated: 18 Dec 2019

Calibration due: 18 Dec 2021

Calibration Standards Used

MANUFACTURER	MODEL	SERIAL NUMBER	INTERVAL	CAL. DUE	TRACEABILITY NO.
Larson Davis	2900 / 2239	0608 / 0110	12 Months	26 Dec 2019	2018-207644

Reference Standards are traceable to the National Institute of Standards and Technology (NIST)

Calibration Environmental Conditions

Temperature: 24 ° Centigrade

Relative Humidity: 17 %

Affirmations

This Certificate attests that this instrument has been calibrated under the stated conditions with Measurement and Test Equipment (M&TE) Standards traceable to the U.S. National Institute of Standards and Technology (NIST). All of the Measurement Standards have been calibrated to their manufacturers' specified accuracy / uncertainty. Evidence of traceability and accuracy is on file at Provo Engineering & Manufacturing Center. An acceptable accuracy ratio between the Standard(s) and the item calibrated has been maintained. This instrument meets or exceeds the manufacturer's published specification unless noted.

The collective uncertainty of the Measurement Standard used does not exceed 25% of the applicable tolerance for each characteristic calibrated unless otherwise noted.

The results documented in this certificate relate only to the item(s) calibrated or tested. A one year calibration is recommended, however calibration interval assignment and adjustment are the responsibility of the end user. This certificate may not be reproduced, except in full, without the written approval of the issuer.

"AS RECEIVED" data unavailable due to unit failure.

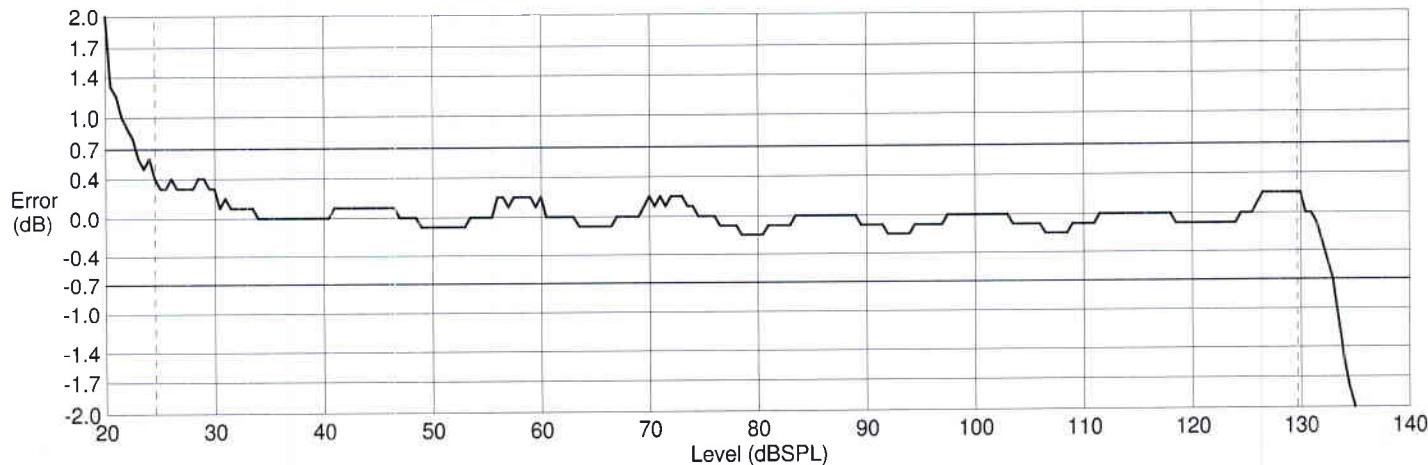

Tested with PRM828-2095

Plotted per typical sensitivity of a 2541 microphone; 44.5 mV/Pa & 17.1 pF.

Overload occurs at 129.8 dB SPL.

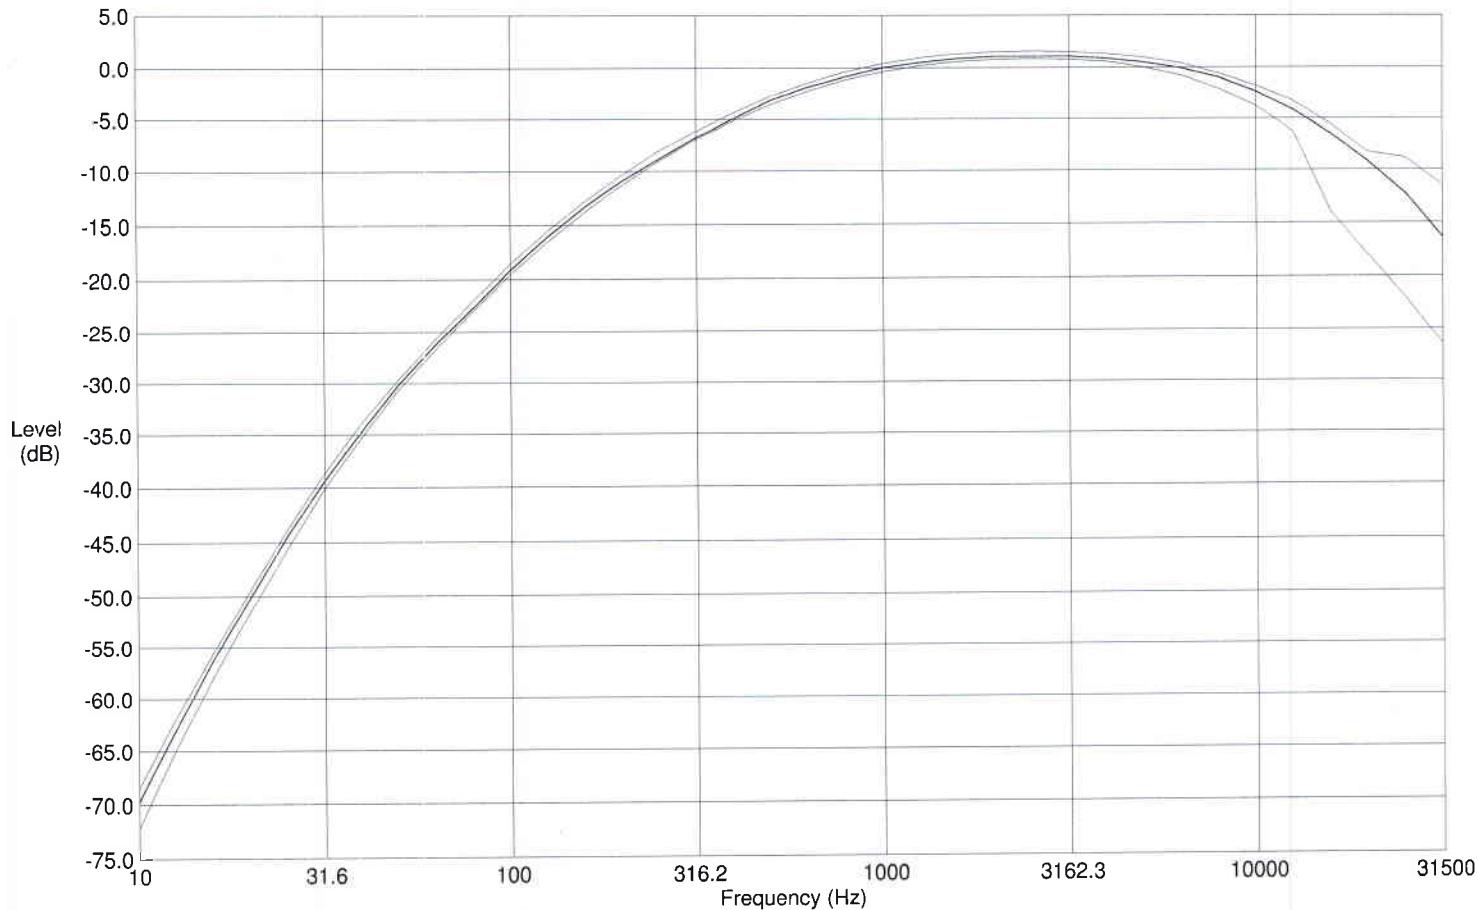

Primary indicator range: 105.2 dB (lower limit: 24.5 dB SPL to upper limit: 129.7 dB SPL).

Dynamic range: 111.8 dB (noise floor: 17.9 dB SPL to upper limit: 129.7 dB SPL).

This instrument is in compliance with IEC 60651 (2001-10) 7.9 and 7.10, ANSI S1.4-1983 3.2 and IEC 60804 (2001-10) 9.2.1 for Type 1 sound level meters when used with a Larson Davis Type 1 microphone.

Sound Level Meter Model: 820A Serial Number: A1375
Certificate of A-Weighted Electrical Conformance

This Type 1 Sound Level Meter (including attached PRM828 preamplifier and ADP005 18 pF input adapter) was calibrated with a reference 1kHz sine wave at a level of 114.0 dB SPL. The instrument's A-weighted response was then electrically tested using a 1.9 Vrms sinewave at exact frequencies as specified in IEC 60651 (2001-10) and ANSI S1.4-1983.

This instrument is in compliance with IEC 60651 (2001-10) 6.1 and 9.2.2, ANSI S1.4-1983 5.1 and 8.2.1, and IEC 60804 (2001-10) 5.1 for Type 1 sound level meters when used with a Larson Davis Type 1 microphone.

Sound Level Meter Model: 820A Serial Number: A1375
Certificate of C-Weight Electrical Conformance

This Type 1 Sound Level Meter (including attached PRM828 preamplifier and ADP005 18 pF input adapter) was calibrated with a reference 1kHz sine wave at a level of 114.0 dB SPL. The instrument's C-weighted response was then electrically tested using a 1.9 Vrms sinewave at exact frequencies as specified in IEC 60651 (2001-10) and ANSI S1.4-1983.

Certificate of Calibration and Conformance

Certificate Number 2020-208999

Instrument Model 820, Serial Number 1939, was calibrated on 13 Feb 2020. The instrument meets factory specifications per Procedure D0001.8160, ANSI S1.4 1983, IEC 651-Type 1 1979, and IEC 804-Type 1 1985.

Instrument found to be in calibration as received: NO

Date Calibrated: 13 Feb 2020

Calibration due: 13 Feb 2022

Calibration Standards Used

MANUFACTURER	MODEL	SERIAL NUMBER	INTERVAL	CAL. DUE	TRACEABILITY NO.
Larson Davis	LDSigGn/2209	0445 / 0111	12 Months	4 Dec 2020	2019-208848

Reference Standards are traceable to the National Institute of Standards and Technology (NIST)

Calibration Environmental Conditions

Temperature: 24 ° Centigrade

Relative Humidity: 17 %

Affirmations

This Certificate attests that this instrument has been calibrated under the stated conditions with Measurement and Test Equipment (M&TE) Standards traceable to the U.S. National Institute of Standards and Technology (NIST). All of the Measurement Standards have been calibrated to their manufacturers' specified accuracy / uncertainty. Evidence of traceability and accuracy is on file at Provo Engineering & Manufacturing Center. An acceptable accuracy ratio between the Standard(s) and the item calibrated has been maintained. This instrument meets or exceeds the manufacturer's published specification unless noted.

The collective uncertainty of the Measurement Standard used does not exceed 25% of the applicable tolerance for each characteristic calibrated unless otherwise noted.

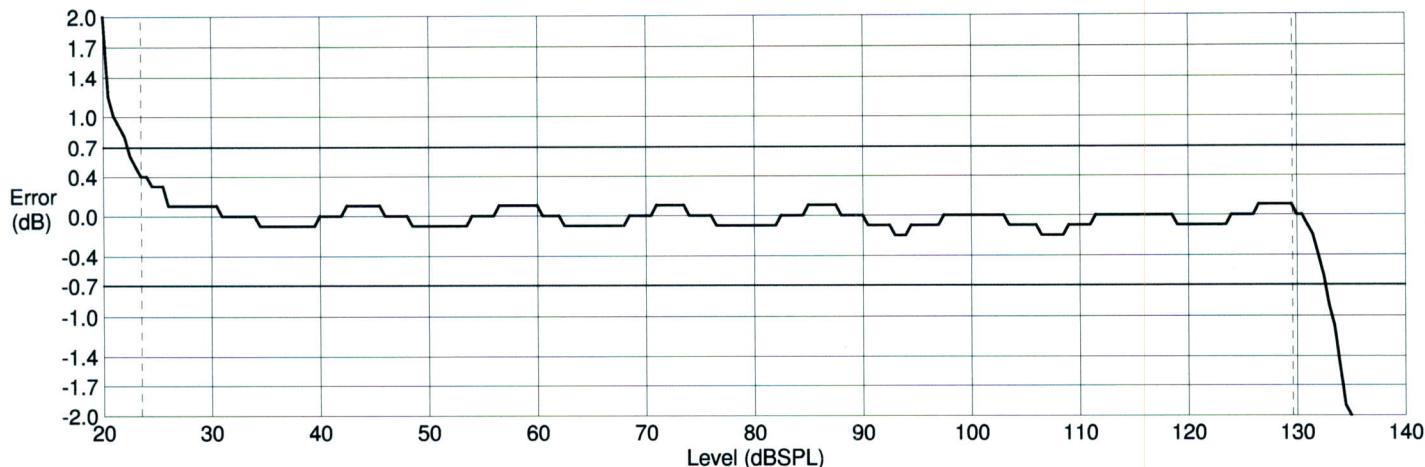

The results documented in this certificate relate only to the item(s) calibrated or tested. A one year calibration is recommended, however calibration interval assignment and adjustment are the responsibility of the end user. This certificate may not be reproduced, except in full, without the written approval of the issuer.

See "AS RECEIVED" data.
Tested with PRM828-3007

Signed: 
Technician: Eric Olson

Sound Level Meter Model: 820A Serial Number: A1939
Log Linearity, Differential Linearity and Range Data

This Type 1 Sound Level Meter (including attached PRM828 preamplifier and ADP005 18 pF input adapter) was calibrated with a reference 1kHz sine wave at a level of 114.0 dB SPL. The instrument's Log Linearity A-weighted slow response was then electrically tested using a 1kHz sine wave from 18.0 dB SPL to 138.0 dB SPL in 0.5 dB increments.

Plotted per typical sensitivity of a 2541 microphone; 44.5 mV/Pa & 17.1 pF.

Overload occurs at 129.7 dB SPL.

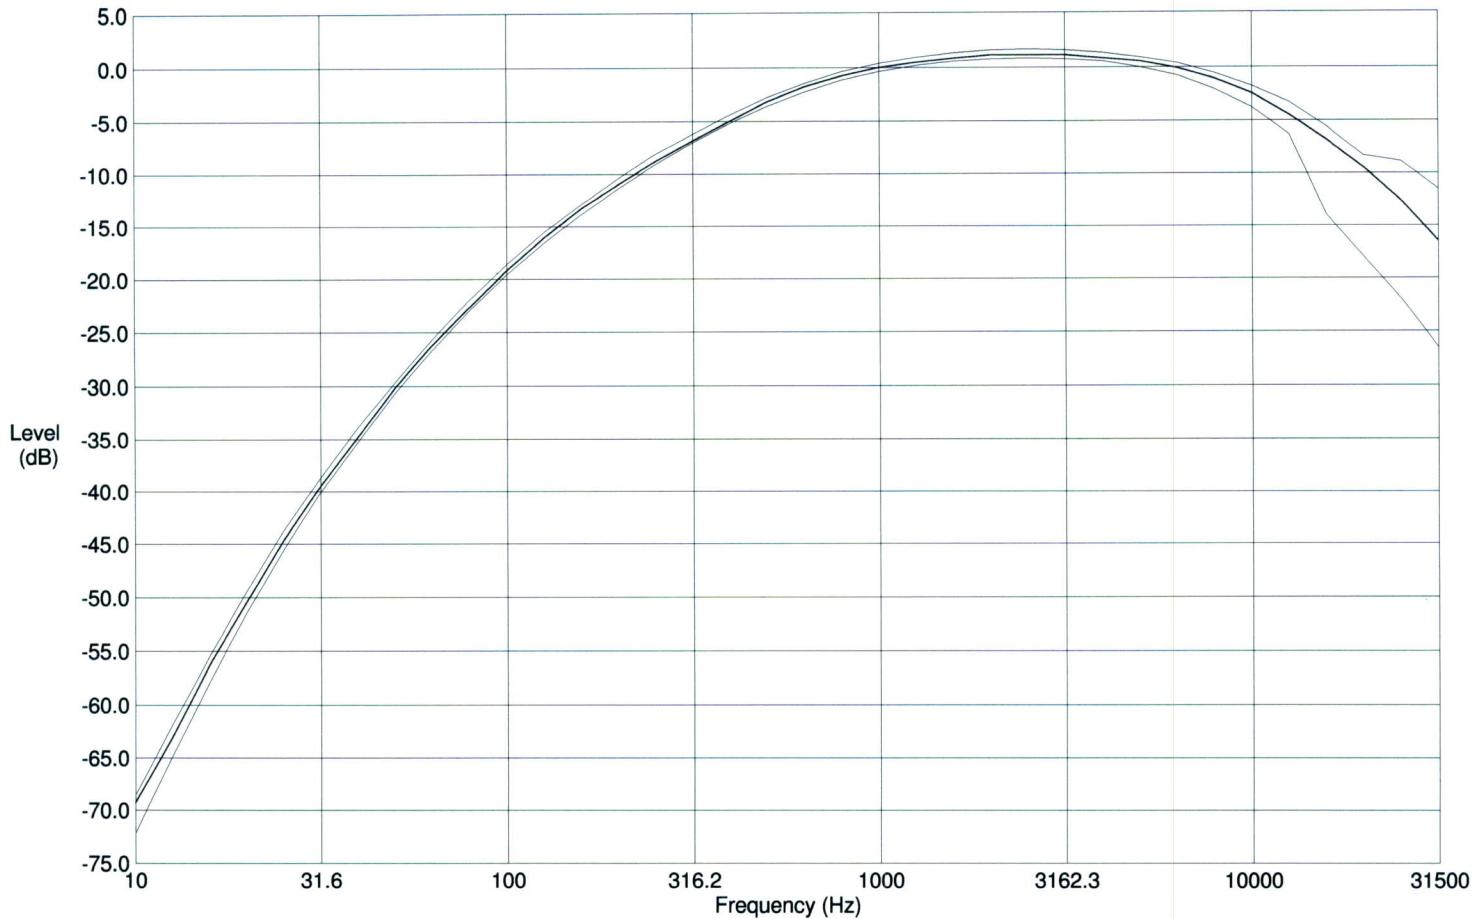

Primary indicator range: 106.1 dB (lower limit: 23.5 dB SPL to upper limit: 129.6 dB SPL).

Dynamic range: 111.9 dB (noise floor: 17.7 dB SPL to upper limit: 129.6 dB SPL).

This instrument is in compliance with IEC 60651 (2001-10) 7.9 and 7.10, ANSI S1.4-1983 3.2 and IEC 60804 (2001-10) 9.2.1 for Type 1 sound level meters when used with a Larson Davis Type 1 microphone.

Sound Level Meter Model: 820A Serial Number: A1939
Certificate of A-Weight Electrical Conformance

This Type 1 Sound Level Meter (including attached PRM828 preamplifier and ADP005 18 pF input adapter) was calibrated with a reference 1kHz sine wave at a level of 114.0 dB SPL. The instrument's A-weighted response was then electrically tested using a 1.9 Vrms sinewave at exact frequencies as specified in IEC 60651 (2001-10) and ANSI S1.4-1983.

Sonoma, CA 95476, United States

Model Number	LxT1	Procedure Number	D0001.8378
Serial Number	0006320	Technician	Ron Harris
Test Results	Pass	Calibration Date	1 Dec 2020
Initial Condition	As Manufactured	Calibration Due	
Description	SoundTrack LxT Class 1 Class 1 Sound Level Meter Firmware Revision: 2.404	Temperature	23.09 °C ± 0.25 °C
		Humidity	52.7 %RH ± 2.0 %RH
		Static Pressure	86.91 kPa ± 0.13 kPa

Evaluation Method Tested electrically using Larson Davis PRMLxT1L S/N 069991 and a 12.0 pF capacitor to simulate microphone capacitance. Data reported in dB re 20 µPa assuming a microphone sensitivity of 23.6 mV/Pa.

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8384:

IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61252:2002	ANSI S1.25 (R2007)
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1
IEC 61260:2001 Class 1	ANSI S1.11 (R2009) Class 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017. **Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.**

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma ($k=2$) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Calibration Certificate

Certificate Number 2021011648

Customer:

Illingworth & Rodkin Inc
429 E Cotati Avenue
Cotati, CA 94931, United States

Model Number	CAL200	Procedure Number	D0001.8386
Serial Number	3012	Technician	Scott Montgomery
Test Results	Pass	Calibration Date	17 Sep 2021
Initial Condition	Adjusted	Calibration Due	17 Sep 2023
Description	Larson Davis CAL200 Acoustic Calibrator	Temperature	23 °C ± 0.3 °C
		Humidity	31 %RH ± 3 %RH
		Static Pressure	101.3 kPa ± 1 kPa

Evaluation Method The data is acquired by the insert voltage calibration method using the reference microphone's open circuit sensitivity. Data reported in dB re 20 μ Pa.

Compliance Standards Compliant to Manufacturer Specifications per D0001.8190 and the following standards:
IEC 60942:2017 ANSI S1.40-2006

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the SI through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma ($k=2$) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Initial Assessment

Certificate Number 2021011647

Customer:

Illingworth & Rodkin Inc
429 E Cotati Avenue
Cotati, CA 94931, United States

Model Number	CAL200	Procedure Number	D0001.8386
Serial Number	3012	Technician	Scott Montgomery
Test Results	Pass	Calibration Date	17 Sep 2021
Initial Condition	As Received	Calibration Due	17 Sep 2023
Description	Larson Davis CAL200 Acoustic Calibrator	Temperature	23 °C ± 0.3 °C
		Humidity	31 %RH ± 3 %RH
		Static Pressure	101.2 kPa ± 1 kPa

Evaluation Method The data is acquired by the insert voltage calibration method using the reference microphone's open circuit sensitivity. Data reported in dB re 20 μ Pa.

Compliance Standards Compliant to Manufacturer Specifications per D0001.8190 and the following standards:
IEC 60942:2017 ANSI S1.40-2006

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the SI through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017.

Test points marked with a † in the uncertainties column do not fall within this laboratory's scope of accreditation.

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma ($k=2$) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Total Harmonic Distortion + Noise (THD+N) Over Pressure

Tested at: 114 dB, 23 °C, 31 %RH

Nominal Pressure [kPa]	Pressure [kPa]	Test Result [%]	Lower limit [%]	Upper limit [%]	Expanded Uncertainty [%]	Result
108.0	108.1	0.29	0.00	2.00	0.25 ±	Pass
101.3	101.4	0.28	0.00	2.00	0.25 ±	Pass
92.0	92.1	0.27	0.00	2.00	0.25 ±	Pass
83.0	83.0	0.26	0.00	2.00	0.25 ±	Pass
74.0	73.8	0.25	0.00	2.00	0.25 ±	Pass
65.0	65.0	0.26	0.00	2.00	0.25 ±	Pass

-- End of measurement results--Signatory: Scott Montgomery
