## **Introduction**

The Midpoint at 237 Project would facilitate the development of four Research & Development (R&D) buildings and two manufacturing buildings at the approved former Cisco Alviso site, now referred to as Midpoint. The approved Cisco Alviso project consisted of 2.325 million square feet of R&D space. The proposed Midpoint project is comparable to the approved Cisco project in that it is proposing to build commercial development. This project would include manufacturing uses, rather than the approved Research and Development uses. Since the Cisco Alviso project was approved, there has been one R&D project built with 427,000 square feet and another R&D project approved with 614,000 square feet, for a total of 1.04 million square feet. The Midpoint project proposes to develop the remainder of the Cisco site with 415,000 square feet of R&D space and three manufacturing buildings that would total 547,000 square feet. This would bring the total on the Cisco site to just over 2 million square feet, which is within the total approved project size.

Because the project would not construct more land uses or generate more traffic than evaluated under the Cisco Alviso project, air pollutant emissions associated with the project affecting regional air quality do not need to be addressed. However, the project may have local effects due to construction and operation. This analysis addresses community risk impacts due to project construction and generation of truck traffic associated with the manufacturing uses. Community risk impacts are addressed by predicting excess cancer risk and annual fine particulate matter concentrations ( $PM_{2.5}$ ) associated with construction and operation of the project.

## **Discussion of TACs**

Toxic Air Contaminants (TACs) are a broad class of compounds known to cause morbidity or mortality (usually because they cause cancer or serious illness) and include, but are not limited to, criteria air pollutants. TACs are found in ambient air, especially in urban areas, and are caused by industry, agriculture, fuel combustion, and commercial operations (e.g., dry cleaners). TACs are typically found in low concentrations, even near their source (e.g., diesel particulate matter near a highway). Because chronic exposure can result in adverse health effects, TACs are regulated at the regional, state, and federal level. The identification, regulation, and monitoring of TACs is relatively new compared to that for criteria air pollutants that have established ambient air quality standards. TACs are regulated or evaluated on the basis of risk to human health rather than comparison to an ambient air quality standard or emission-based threshold.

### **Diesel Particulate Matter**

Diesel exhaust, in the form of diesel particulate matter (DPM), is the predominant TAC in urban air with the potential to cause cancer. It is estimated to represent about two-thirds of the cancer risk from TACs (based on the statewide average). According to the California Air Resource Board (CARB), diesel exhaust is a complex mixture of gases, vapors, and fine particles. This complexity makes the evaluation of health effects of diesel exhaust a complex scientific issue. Some of the chemicals in diesel exhaust, such as benzene and formaldehyde, have been previously identified as TACs by the CARB, and are listed as carcinogens either under the State's Proposition 65 or under the federal Hazardous Air Pollutants programs. California has adopted a comprehensive diesel risk reduction program. The U.S. Environmental Protection Agency (EPA) and the CARB have adopted low-sulfur diesel fuel standards in 2006 that reduces diesel particulate matter substantially. The CARB recently adopted new regulations requiring the retrofit and/or replacement of construction equipment, on-highway diesel trucks, and diesel

buses in order to lower fine particulate matter ( $PM_{2.5}$ ) emissions and reduce statewide cancer risk from diesel exhaust.

### Fine Particulate Matter ( $PM_{2.5}$ )

Particulate matter in excess of state and federal standards represents another challenge for the Bay Area. Elevated concentrations of  $PM_{2.5}$  are the result of both region-wide (or cumulative) emissions and localized emissions. High particulate matter levels aggravate respiratory and cardiovascular diseases, reduce lung function, increase mortality (e.g., lung cancer), and result in reduced lung function growth in children.

### Sensitive Receptors

There are groups of people more affected by air pollution than others. CARB has identified the following persons who are most likely to be affected by air pollution: children under 14, the elderly over 65, athletes, and people with cardiovascular and chronic respiratory diseases. These groups are classified as sensitive receptors. Locations that may contain a high concentration of these sensitive population groups include residential areas, hospitals, daycare facilities, elder care facilities, elementary schools, and parks. For cancer risk assessments, children are the most sensitive receptors, since they are more susceptible to cancer causing TACs. Residential locations are assumed to include infants and small children. The closest sensitive receptors to the project site are existing single-family residences immediately south of the site. Additionally, George Mayne Elementary School is located immediately south. Jubilee Christian Center is located to the north. It is unclear if this location includes sensitive receptors. To be conservative, this analysis assumed daycare facilities were part of this land use.

### **Community Risk Thresholds of Significance**

The Bay Area Air Quality Management District (BAAQMD) identified significance thresholds for exposure to TACs and  $PM_{2.5}$  as part of its May 2011 *CEQA Air Quality Guidelines*<sup>1</sup>. This report uses the thresholds and methodologies from BAAQMD's May 2011 *CEQA Air Quality Guidelines* to determine whether there would be any project health risk impacts. This report addresses single-source (construction and operational) impacts to nearby off-site receptors. This impact would be considered significant and mitigation would be required if:

1. An excess cancer risk level of more than 10 in 1 million, or a non-cancer (chronic or acute) hazard index greater than 1.0.
2. An incremental increase of more than 0.3 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ) annual average  $PM_{2.5}$ .

### **Construction Community Risk Impacts**

Construction activity is anticipated to include grading, building construction, paving and application of architectural coatings. During grading, and some building construction activities, substantial amounts of dust could be generated. Most of the dust would result during grading activities. The amount of dust generated would be highly variable and would be dependent on the size of the area disturbed at any given time, amount of activity, soil conditions, and meteorological conditions. To address fugitive dust emissions that lead to elevated  $PM_{10}$  and  $PM_{2.5}$  levels near construction sites, the BAAQMD *CEQA Air Quality Guidelines* identify best control measures. If included in construction projects, these impacts will be considered less than significant. These features include the following:

---

<sup>1</sup> BAAQMD, 2011. *BAAQMD CEQA Air Quality Guidelines*. May.

1. All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day.
2. All haul trucks transporting soil, sand, or other loose material off-site shall be covered.
3. All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
4. All vehicle speeds on unpaved roads shall be limited to 15 mph.
5. All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible.
6. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.
7. Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California airborne toxics control measure Title 13, Section 2485 of California Code of Regulations). Clear signage shall be provided for construction workers at all access points.
8. All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.
9. Post a publicly visible sign with the telephone number and person to contact at the Lead Agency regarding dust complaints. This person shall respond and take corrective action within 48 hours. The Air District's phone number shall also be visible to ensure compliance with applicable regulations.

Construction equipment and associated heavy-duty truck traffic generates diesel exhaust, which is a TAC. BAAQMD has developed screening tables for evaluating potential impacts from toxic air contaminants emitted at construction projects.<sup>2</sup> The screening tables are described by BAAQMD as “environmentally conservative interim guidance” and are meant to be used to identify potentially significant impacts that should be modeled using refined techniques. These screening tables indicate that construction activities similar to this project could have significant impacts at distances beyond 100 meters or 330 feet, with the primary impact being excess cancer risk. However, these screening tables are based on older construction equipment that has higher emission rates and the load factors assumed were considerably higher than those recently recommended by the CARB. Since project construction activities would include grading, and building construction that would last longer than 6 months and would be located within 330 feet of sensitive receptors, a more refined-level study of community risk assessment was conducted to evaluate whether impact would be significant, and if so, identify the project features or mitigation measures that would be necessary to avoid significant impacts in terms of community risk impacts to nearby sensitive receptors (e.g., adjacent residences).

#### *On-Site Construction TAC Emissions*

This refined health risk assessment focused on modeling on-site construction activity using construction fleet information included in the project design. Construction period emissions were modeled using the California Emissions Estimator Model, Version 2013.2.2 (CalEEMod) along with projected construction activity. The number and types of construction equipment and diesel vehicles, along with the anticipated length of their use for different phases of construction were based on the provided site-specific construction activity schedule. Construction of the project is expected to occur over about a 16-month period assumed to begin in Fall 2014 and continue through Spring 2016.

Construction emissions were modeled as two separate model runs. One run addressed the construction of Manufacturing Buildings 1 and 2 that are 167,000 and 163,000 square feet in size. The second model run included Building 3 at 217,000 square feet, along with the 415,000 square feet of Research &

---

<sup>2</sup> BAAQMD. 2010. *Screening Tables for Air Toxics Evaluation During Construction*. May.

Development Buildings. Construction schedules along with the quantity and operating schedule of equipment for each of the two phases were provided. In addition, truck trips were estimated based on the quantities of material (i.e., fill or cement) to be imported. These data were input to each of the CalEEMod model input files.

The CalEEMod model provided total annual PM<sub>2.5</sub> exhaust emissions (assumed to be diesel particulate matter) for the off-road construction equipment and for exhaust emissions from on-road vehicles (haul trucks, vendor trucks, and worker vehicles), with total emissions of 0.137 tons (274 pounds) in 2014, 0.314 tons (628 pounds) in 2015, and 0.01 tons (20 pounds) in 2016. The on-road emissions are a result of haul truck travel during grading activities, worker travel, and vendor deliveries during building construction. A trip length of 1 mile was used to represent vehicle travel while at or near the construction site. It was assumed that these emissions from on-road vehicles traveling at or near the site would occur at the construction site. Fugitive PM<sub>2.5</sub> dust emissions were calculated by CalEEMod as 0.142 tons (284 pounds) in 2014, 0.099 tons (198 pounds), and 0.0002 tons (0.4 pounds) in 2016. The CalEEMod model output with emission calculations are provided in *Attachment 1*. The construction schedule and equipment list is also provided in Attachment 1.

### *Dispersion Modeling*

The U.S. EPA ISCST3 dispersion model was used to predict concentrations of DPM at existing sensitive receptors in the vicinity of the project site. The ISCST3 modeling utilized area sources to represent the on-site construction emissions, two for DPM exhaust emissions and two for fugitive PM<sub>2.5</sub> dust emissions. The ISCST3 modeling utilized area sources to represent different areas on-site construction activities. These areas are shown on Figure 1. For each construction area, area sources were used to model exhaust emissions and fugitive dust (PM<sub>2.5</sub>) emissions. Emissions were distributed evenly across the areas sources. To represent the construction equipment exhaust emissions, an emission release height of 6 meters (20 feet) was used for the area sources. The elevated source height reflects the height of the equipment exhaust pipes and buoyancy of the exhaust plume. For modeling fugitive PM<sub>2.5</sub> emissions, a near ground level release height of 2 meters (6 feet) was used for the area sources. Emissions from truck travel at the project site were included in the area sources. Emissions were modeled as occurring daily between 7 am - 4 pm. The model used a 5-year data set (1996-2000) of hourly meteorological data from Alviso available from the BAAQMD. Annual DPM concentrations from construction activities were predicted for 2014 through 2016, with the annual average concentrations based on the 5-year average concentrations from modeling 5 years of meteorological data. DPM concentrations were calculated at nearby sensitive receptors at a height of 1.5 meters (5 feet).

### *Cancer Risk and Hazards*

The maximum-modeled annual DPM concentration occurred at the residence north of the project site along Grand Boulevard. The location of this receptor is identified on Figure 1. Increased cancer risks were calculated using the modeled annual concentrations and BAAQMD recommended risk assessment methods for a child exposure (3rd trimester through 2 years of age), student exposure (9 years) and for an adult exposure. Since the modeling was conducted under the conservative assumption that emissions occurred 365 days per year, the default BAAQMD exposure period of 350 days per year was used for children and adults.

Table 1 reports the community risk impacts associated with construction activities at the various sensitive receptor types near the project. Results of this assessment indicate that, with project construction, the incremental child cancer risk at the maximally exposed individual (MEI) would be 6.0 in one million and the adult incremental cancer risk would be 0.3 in one million. These predicted excess cancer risks are

below the BAAQMD significance threshold of 10 in one million and are not considered a significant impact.

The modeled maximum annual PM<sub>2.5</sub> concentration was 0.07 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ), occurring at George Mayne Elementary School near the southern boundary of the construction area at a height of 1.5 meters. This PM<sub>2.5</sub> concentration is below the BAAQMD threshold of 0.3  $\mu\text{g}/\text{m}^3$  used to judge the significance of impacts for PM<sub>2.5</sub>.

**Figure 1 Project Site, Sensitive Receptors, and Location of Maximum Cancer Risk from Construction**

**Table 1 Construction Period Community Risk Impacts**

Receptor	Community Risk Impact		
	Excess Cancer Risk (per million)	Annual PM <sub>2.5</sub> ( $\mu\text{g}/\text{m}^3$ )	Hazard Index
Residential – child	6.0	0.06	<0.01
Residential - adult	0.3	0.06	<0.01
School - child	1.9	0.07	0.01

Potential non-cancer health effects due to chronic exposure to DPM were also evaluated. The chronic inhalation reference exposure level (REL) for DPM is 5  $\mu\text{g}/\text{m}^3$ . The maximum predicted annual DPM concentration was 0.05  $\mu\text{g}/\text{m}^3$ , which is much lower than the REL. The Hazard Index (HI), which is the ratio of the annual DPM concentration to the REL, is 0.01. This HI is much lower than the BAAQMD significance criterion of a HI greater than 1.0.

The project would have *a less-than-significant* impact with respect to community risk caused by construction activities. *Attachment 1* includes the emission calculations used for the area source modeling, dispersion modeling inputs, and the cancer risk calculations.

### Operational Community Risk Impacts

The manufacturing component of the project would be a source of truck traffic on a regular basis. Trucks would be a source diesel particulate matter (DPM) emissions from future loading activities and nearby travel. According to the project traffic analysis, approximately 220 one-way truck trips would be generated each day<sup>3</sup>. These truck trips would use Disk Drive, Nortech Parkway and North First Street. Community risk impacts were predicted from this activity.

Emissions from truck activity were computed using the California Air Resources Board's EMFAC2011 model. Emissions were calculated using emission rates for 2016 for diesel-fueled heavy duty truck (HHDT) trucks in Santa Clara County. The project was assumed to generate 220 one-way trips that would occur over a 24-hour period 365 days per year. Emissions were calculated assuming a travel speed of 10 miles per hour (mph) on site and 30 mph on Disk Drive, Nortech Parkway and North 1<sup>st</sup> Street. Emissions for years beyond 2016 were assumed to be the same as those for 2016.

The U.S. EPA ISCST3 dispersion model was also used to predict concentrations of DPM from truck activity. Modeling was conducted using the 5 year hourly meteorological data set from Alviso obtained from BAAQMD. Truck emissions were modeled as line sources (a series of volume sources along a line) representing travel routes from Midpoint to the north then east along Disk Drive, south along Nortech Parkway and east along North First Street. DPM concentrations were predicted at receptors near the project site at a height of 1.5 meters (5 feet). Based on modeled DPM concentrations, cancer risks were calculated for a 70-year exposure assuming constant emissions at 2016 levels over the entire 70 year period. A cancer risk adjustment factor of 1.7 was used for this analysis to account for age sensitivity. Figure 2 shows the modeled truck routes, receptors, and location of maximum impacts. Modeling information is included in *Attachment 1*.

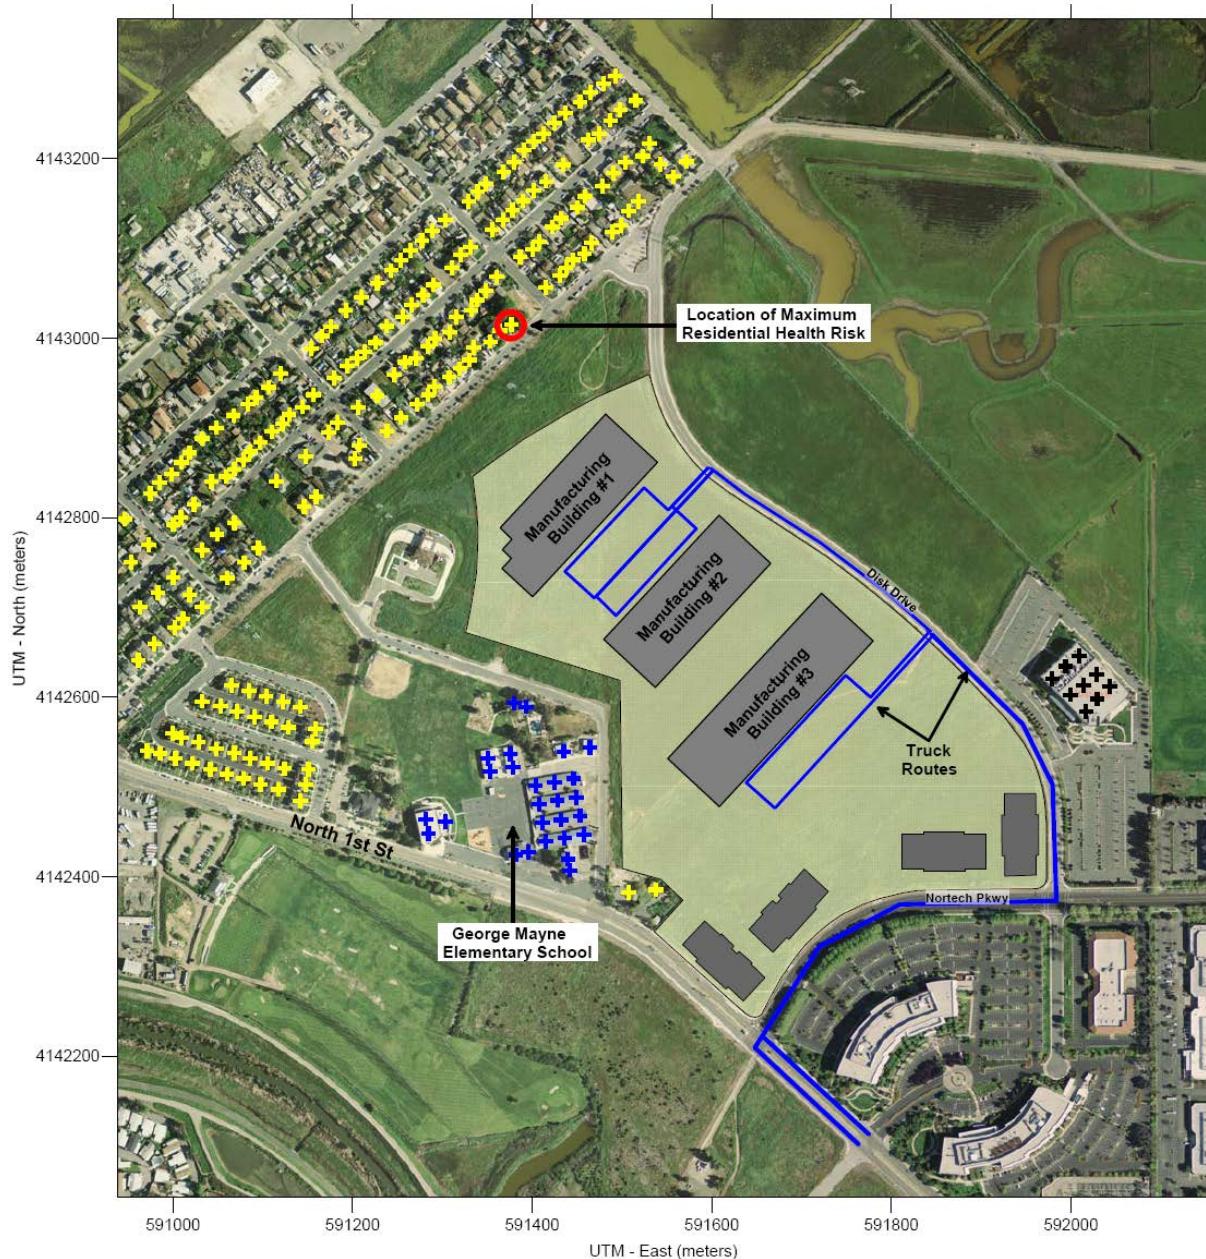

---

<sup>3</sup> Memo from Gary Black and Robert Del Rio of Hexagon Transportation Consultants, Inc., Subject: Midpoint Supplemental Traffic Study, dated November 27, 2013.

The maximum increased DPM cancer risk from the project site truck emissions is 0.6 per million. The annual PM<sub>2.5</sub> concentration due to DPM emissions would be 0.00113  $\mu\text{g}/\text{m}^3$ . The corresponding Hazard Index would be well below 1.0.

Substantial sources of TACs are not located within 1,000 feet of the project site. Excess cancer risk associated project construction and operation would be less than 6.6 chances per million. The maximum annual PM<sub>2.5</sub> concentration would be less than 0.07  $\mu\text{g}/\text{m}^3$ . This impact would be considered *less than significant*.

**Figure 2 Project Site, Sensitive Receptors, and Location of Maximum Cancer Risk From Operation**

**Table 2 Operational Period Community Risk Impacts**

Receptor	Community Risk Impact		
	Excess Cancer Risk (per million)	Annual PM <sub>2.5</sub> ( $\mu\text{g}/\text{m}^3$ )	Hazard Index
Residential – lifetime	1.4	<0.01	<0.01
School Student – 9 years	0.6	<0.01	< 0.01

<sup>1</sup> HHDT = heavy heavy duty truck

<sup>2</sup> Annual trips - Based on 365 days of operation

<sup>3</sup> Emission factors from EMFAC2011 for Santa Clara Co. for operation in 2016 and assumes all trucks are diesel.

<sup>4</sup> Operation hours assumed to be 24 hours per day, 365 days per year

<sup>5</sup> Assumes 5 minutes idle per trip

**Midpoint - Alviso, CA - Operational Impacts**  
**Maximum DPM Cancer Risk Calculations From Heavy-Duty Trucks**

<b>DPM Emission Rates</b>	
<b>Source Type(s)</b>	<b>Annual DPM (lb/yr)</b>
On & Off-site Delivery Trucks	12.9

**Modeling Information**

Model:	ISCST3
Source	On- & Off-site Delivery Trucks
Source Type	9 Line-Volume Sources
Meteorological Data	Alviso Hourly Met Data 1996 - 2000 (from BAAQMD)
<b>Line-Volume Source Parameters</b>	
Line Source Lengths	variable (refer to emissions table)
Volume Plume Height	6.8 m
Volume Plume Width	12 ft & 24 ft (lane/road widths)
Volume Release Height	3.4 m
Hourly Emission Rate (lb/hr)	variable (refer to emissions table)
<b>Receptors</b>	
Number of Receptors	224
Receptor Spacing	10 m (33 ft)
Receptor Height	15 m (4.9 ft)

**Cancer Risk Calculation Method**

$$\text{Inhalation Dose} = C_{\text{air}} \times DBR \times A \times HD \times EF \times ED \times 10^{-6} / AT$$

Where:  $C_{\text{air}}$  = concentration in air ( $\mu\text{g}/\text{m}^3$ )

DBR = daily breathing rate ( $\text{L}/\text{kg}$  body weight-day)

A = Inhalation absorption factor

EF = Exposure frequency (days/year)

HD = daily exposure (hours/day/24)

ED = Exposure duration (years)

AT = Averaging time period over which exposure is averaged.

$10^{-6}$  = Conversion factor

**Inhalation Dose Factors**

<b>Exposure Type</b>	<b>Value<sup>1</sup></b>							
	<b>DBR (L/kg BW-day)</b>	<b>A (-)</b>	<b>Exposure (hr/day)</b>	<b>Exposure (days/week)</b>	<b>Exposure (week/year)</b>	<b>EF (days/yr)</b>	<b>ED (Years)</b>	<b>AT (days)</b>
Residential (70-Year)	302	1	24	7	50	350	70	25,550
Student (9-Year)	581	1	10	5	36	180	9	25,550

<sup>1</sup> Default values recommended by OEHHA & Bay Area Air Quality Management District

$$\text{Cancer Risk (per million)} = \text{Inhalation Dose} \times CRAF \times CPF \times 10^6$$

$$= URF \times Cair$$

Where: CPF = Cancer potency factor ( $\text{mg}/\text{kg}\cdot\text{day}$ )<sup>-1</sup>

CRAF = Cancer Risk Adjustment Factor

URF = Unit risk factor (cancer risk per  $\mu\text{g}/\text{m}^3$ )

**Unit Risk Factor for DPM**

<b>Exposure Type</b>	<b>CPF (mg/kg-day)<sup>-1</sup></b>	<b>CRAF (-)</b>	<b>URF DPM</b>
Residential (70-Yr Exposure)	1.10E+00	1.7	<b>541.5</b>
Student (9-Year)	1.10E+00	3	<b>50.7</b>

**Model Results and Cancer Risks**

<b>Exposure Type</b>	<b>Maximum</b>	
	<b>DPM/PM2.5 Annual Ave (<math>\mu\text{g}/\text{m}^3</math>)</b>	<b>DPM Cancer Risk (per million)</b>
Residential (70-Yr Exposure)	0.00113	<b>0.61</b>
Jubilee Christian Center (9-year)*	0.00187	<b>0.09</b>
Elementary School Student (9-Year)	0.00092	<b>0.05</b>

\* exposure assumed to be similar to school students.

## 1.0 Project Characteristics

---

### 1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Manufacturing	330.00	1000sqft	20.00	330,000.00	0
Parking Lot	2,387.00	Space	0.00	954,800.00	0

### 1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	58
Climate Zone	4			Operational Year	2016
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	370	CH4 Intensity (lb/MWhr)	0.029	N2O Intensity (lb/MWhr)	0.006

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - Based on PG&E rate

Land Use - Based on project size and estimate of acreage. All acreage assumed for land uses

Construction Phase - Based on Project phases and Schedule

Off-road Equipment - Project list

Off-road Equipment - Based on list

Off-road Equipment - Project list

Off-road Equipment - Based on list

Off-road Equipment - Based on construction list

Off-road Equipment - Project list

Trips and VMT - Includes asphalt import for subgrade base & paving. Added cement trucks at vendor haul length. Added in water trucks and tenders

Grading - Based on project list: material = 31,500 and asphalt = 9,500 tons

Vehicle Trips - Using Hexagon rates that are similar to CalEEMod default

Construction Off-road Equipment Mitigation - Tier 2 and BMPs

Subgrade, Base paving	10	25.00	0.00	4,058.00	1.00	1.00	1.00	LD_Mix	HDT_Mix	HHDT
Building Shell	24	540.00	211.00	3,444.00	1.00	1.00	1.00	LD_Mix	HDT_Mix	HHDT
Utilities	8	20.00	0.00	8.00	1.00	1.00	1.00	LD_Mix	HDT_Mix	HHDT
Site Concrete, Landscape & Finishes	12	30.00	0.00	302.00	1.00	1.00	1.00	LD_Mix	HDT_Mix	HHDT
Paving	10	25.00	0.00	0.00	12.40	7.30	20.00	LD_Mix	HDT_Mix	HHDT
Building Interior, Exterior Finishes	24	108.00	0.00	0.00	12.40	7.30	20.00	LD_Mix	HDT_Mix	HHDT

### **3.1 Mitigation Measures Construction**

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

Clean Paved Roads

### **3.2 Subgrade, Base paving - 2014**

## 1.0 Project Characteristics

---

### 1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Research & Development	415.00	1000sqft	15.00	415,000.00	0
Manufacturing	217.00	1000sqft	7.00	217,000.00	0
Parking Lot	1,500.00	Space	13.50	600,000.00	0

### 1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	58
Climate Zone	4			Operational Year	2016
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	370	CH4 Intensity (lb/MWhr)	0.029	N2O Intensity (lb/MWhr)	0.006

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - Based on PG&E rate

Land Use - Based on project size and estimate of acreage. All acreage assumed for land uses

Construction Phase - Based on Project phases and Schedule

Off-road Equipment - Project list

Off-road Equipment - Based on list

Off-road Equipment - Project list

Off-road Equipment - Based on list

Off-road Equipment - Based on construction list

Off-road Equipment - Project list

Trips and VMT - Includes asphalt import for subgrade base & paving. Added cement trucks at vendor haul length. Added in water trucks and tenders

Grading - Based on project list: material = 31,500 and asphalt = 9,500 tons

Vehicle Trips - Using Default rates that are similar to Hexagon

Construction Off-road Equipment Mitigation - Tier 2 and BMPs

### **3.1 Mitigation Measures Construction**

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

Clean Paved Roads

### **3.2 Subgrade, Base paving - 2015**
