## Executive Summary

---

The purpose of this traffic study is to evaluate the traffic impacts associated with the proposed buildout of the Communications Hill Specific Plan area. The entire Communications Hill Specific Plan area comprises approximately 900 acres of hilly land located approximately four miles south of downtown San José. The Plan Area is bounded by Curtner Avenue to the north, Monterey Road to the east, Capitol Expressway, Snell Avenue, and Hillsdale Avenue to the south, and Guadalupe Freeway (SR 87) to the west. The Oak Hill Cemetery is located adjacent to the northeastern boundary of the Plan area.

The proposed project site is within the Specific Plan Area near the top of the hill adjacent to the existing KB Home Tuscany Hills development. The project site is generally bounded by the Caltrain/Union Pacific railroad tracks on the east, Old Hillsdale Avenue to the south, the Tuscany Hills development to the west, and the Millpond and Dairy Hill neighborhoods to the north. The site is vacant and comprised primarily of grassland. The residential/commercial portion of the site is approximately 79 gross acres, while the industrial property is approximately 55 gross acres.

## Project Description

The proposed project is the build-out of up to the remaining approximately 2,300 residential units allowed within the Specific Plan Area, which is anticipated to occur over a 12-15 year timeframe. It also includes construction of up to 64,800 square feet of commercial/retail uses, parks, open space, trails, streets, storm water facilities, and other associated supporting infrastructure. The proposed 2,300 residential units will consist of townhomes/flats, detached alley townhomes, detached row townhomes, podium condominiums, and apartments in the Village Center. Four podium condominium buildings are proposed as part of the project. Uses within the commercial/retail area would include restaurants, shops, entertainment, and small office consistent with the Specific Plan. Approximately 16 acres of parks and 112 acres of open space will be constructed as part of the proposed project.

The proposed project also includes the future development of approximately 55 acres of industrial park uses in the eastern portion of the site near the base of Communications Hill adjacent to Old Hillsdale Avenue. Details for this development have not yet been determined, although it is anticipated that it would have a Floor Area Ratio (FAR) of approximately 0.6. This would allow approximately 1.44 million square feet of industrial park development, consistent with the Specific Plan and the City's Zoning Ordinance.

Roadways constructed as part of previous development on Communications Hill (primarily the Tuscany Hills project) were sized to accommodate the proposed project. However, the existing roadways would be extended onto the site. As part of the project, the extension of Communications Hill Boulevard including a bridge over the Caltrain/UPRR tracks will be completed. The Communications Hill bridge will accommodate all modes of travel including vehicles, pedestrians, and bicycles. The extension of Communications Hill Boulevard and new bridge will provide a continuous roadway connection between Hillsdale Avenue and Curtner Avenue, and ultimately, to the SR 87 Curtner Avenue ramps.

## Scope of Study

The purpose of the study is to identify the potential traffic impacts related to the proposed project. The potential impacts related to the proposed development were evaluated following the standards and methodologies set forth by the City of San Jose and the Santa Clara Valley Transportation Authority (VTA). The VTA administers the County Congestion Management Program (CMP).

The study includes an analysis of AM and PM peak-hour traffic conditions for 82 signalized intersections, one unsignalized intersection, and 56 directional freeway segments within the City of San Jose. The study intersections were selected based upon the estimated number of projected project trips to be added to intersections (10 or more trips per lane per hour). Any intersections outside of the study area, including those in other jurisdictions, to which the project would not add 10 or more trips per lane per hour were not studied because the addition of project traffic would not be a sufficient amount to result in the degradation of intersection levels of service. The study also includes an operations analysis, based on vehicle-storage requirements at select intersections and on-site circulation analysis, which includes level of service analysis and vehicle-storage requirements at planned intersections and roadways on the project site.

Traffic conditions at all of the study intersections and freeway segments were analyzed for the weekday AM and PM peak hours. The weekday AM peak hour of traffic is generally between 7:00 and 9:00 AM and the weekday PM peak hour is typically between 4:00 and 6:00 PM. It is during these periods that the most congested traffic conditions occur on a typical weekday.

## Project Trip Generation

The project as proposed consists of the construction of up to 2,300 residential units, 64,800 s.f. of retail space, up to 1.4 m.s.f. of industrial space, and other supporting services such as a school and parks. The proposed retail and supporting services would primarily serve the existing and the proposed residential units of Communications Hill as well as visitors on the hill. Trip generation estimates for the proposed project were estimated utilizing City of San Jose traffic-forecasting model. The model generated trip estimates were compared with estimates based on standard City of San Jose trip generation rates to ensure that the trip estimates used for the analysis were comparable to those typically used for land uses similar to the proposed project.

### **CUBE Model Trip Generation Estimates**

The City of San Jose's CUBE software-based traffic forecasting model procedures produce projections of AM and PM peak hour traffic generation based on projected land uses. The forecasted trip generation estimates are based on the trip making characteristics of the proposed project land uses. The trip-making characteristics reflected by the model account for mode of travel and interaction of trips between land uses. The forecasts indicate that the project as proposed will generate a net total of 2,636 trips occurring during the AM peak hour and 3,221 trips during the PM peak hour based on the projected trips that start and/or end in the Traffic Analysis Zones (TAZs) that correspond to the project area.

### **Standard Trip Generation Rates**

The standard trip rates, as recommended for use in the City of San Jose are detailed in *the City of San Jose Traffic Impact Analysis Handbook Vol. 1, 2009*. The magnitude of traffic added to the roadway system by a particular development is estimated by multiplying the applicable trip generation rates by the size of the development. The trip estimates for each of the proposed land use components of the proposed project were reduced to account for internalization, or trips made, between each of the proposed land uses. The reductions are based on the assumption that vehicle trips to each of the proposed land uses of the site would be reduced due to internal circulation (i.e. residents patronizing the proposed retail space, or trips made to school and/or work). A reduction of 15% was applied for the

internalization, or trips made between residential and retail uses, as recommended by the VTA's *Transportation Impact Analysis Guidelines*, January 2009.

Similarly, the trip generation for the retail portion of the project also was estimated. The retail space, intended to be neighborhood-serving retail not major retail establishments, is planned to be centrally located within the project area and proposed residential units. As such, it is assumed that the majority of trips generated by the retail space would originate from residential units within the project boundaries. Since it is anticipated that the proposed retail space would mainly serve the residential uses within the project area, the trip estimates for the residential land uses of the project were reduced to account for internalization, or interaction, between the retail and residential land uses. It was assumed that 90 percent of the retail trips would originate from the surrounding residential units located on Communications Hill, including both existing and proposed units. Only 10 percent of the trips estimated to be generated by the retail use were assumed to come from outside Communications Hill.

The trip generation estimates do not include estimates for the proposed school and parks. Trip estimates for residential uses account for trips made to schools and other types of land uses. It is assumed that trips to the supporting land uses would originate from within the project area and the proposed residential units.

Based on trip generation rates recommended by the City of San Jose and the above assumptions regarding trip reductions and internalization, the project as proposed is estimated to generate a net total of 31,409 daily trips, with 3,969 trips occurring during the AM peak hour and 3,620 trips during the PM peak hour.

### ***Adjusted Trip Generation Estimates***

A comparison of trip generation estimates produced using standard trip rates and the model forecasts indicates that the traffic model estimates that the proposed project will generate approximately 35% and 10% less AM and PM peak hour trips, respectively when compared to estimates produced using the standard trip rates. The projected lower trips are likely due to the traffic model assuming a larger percentage of non-auto trips (transit, walk, and bicycle usage).

In order to evaluate a conservative estimate of trips to be generated by the project, the trip generation estimates projected by the model forecasts were adjusted to nearly match, within 0.5%, those estimated using the City's standard trip rates. Based on the adjustments, it is estimated that the proposed project will generate a net total of 3,983 trips occurring during the AM peak hour and 3,628 trips during the PM peak hour. Table 10 presents the comparison of trip generation estimates using both the standard trip rates and the model forecasts. Model forecast also indicate that approximately 12% of the projected peak hour trips that generated by the project would remain within the project boundaries. The internalized trips are composed of trips to and from the proposed homes, school, work, and retail land uses of the propose project.

The analysis represented within this report is based upon the estimated AM and PM peak hour trips. It is during these time periods that the most congested traffic conditions occur on a typical weekday. The City's level of service policy also is based upon the weekday AM and PM peak-hours.

## **Project Impacts and Mitigation Measures**

### ***Background Plus Project Intersection Level of Service Analysis***

The results show that based on the City of San Jose significance criteria, four of the study intersections would be significantly impacted by the project.

- 3 Monterey Road and Curtner Avenue\*
- 13 Almaden Expressway and Foxworthy Avenue
- 22 Communications Hill Boulevard and Curtner Avenue

### 33 Snell Avenue and Capitol Expressway\*

Two of the four intersections identified to be significantly impacted by the project based on City of San Jose criteria are CMP designated intersections. The two CMP intersections are projected to meet the CMP LOS standard of LOS E.

Potential physical improvements were identified at each of the impacted intersections and are described in detail in Chapter 5. However, each of the identified improvements will require the acquisition of right-of-way that is not currently available. Thus, in lieu of the identified physical mitigations, which are infeasible, this project relies on the adoption of an Area Development Policy (ADP) to establish special traffic level of service standards for a specific geographic area; the Communications Hill Specific Plan area. Impacts at these intersections would be significant and unavoidable due to the lack of feasible mitigation to reduce these impacts to a less than significant level.

The ADP would provide new and enhanced non-auto travel mode facilities such as trails, bikeways, connections to transit, and improvements on major roadways and freeway entrances. While these improvements would not reduce the identified intersection impacts to a less than significant level, they are consistent with General Plan goals and policies that seek to maximize the efficiency, safety, and connectivity of the existing street system while promoting complete streets that provide for pedestrian, bicycle, and public transit modes of travel. The planned improvements included in the Communications Hill Specific Plan ADP are described in the following section.

#### ***Communications Hill Area Development Policy***

The Communications Hill Specific Plan Area Development Policy (CHSPADP) will provide for the implementation of several improvements to the roadway system, transit system, and pedestrian and bicyclist facilities in the immediate area of the proposed project. The purpose of the ADP is to establish a variance from the City's standard Level of Service Policy to allow for a balanced transportation system as identified by goals and policies of the City of San Jose Envision 2040 General Plan. The Envision 2040 General Plan allows for exceptions to the City's standard Level of Service Policy with the establishment of an ADP with the intent to meet City of San Jose Transportation Policies. In particular, the CHSPADP provides for improvement to the transportation system to meet the City of San Jose Transportation Policies that provide for the following:

- Encourage the use of non-automobile travel modes to reduce vehicle miles traveled (VMT)
- Consider the impact on the overall transportation system when evaluating the impacts of new developments.
- Increase substantially the proportion of travel modes other than single-occupant vehicles.

Rather than constructing improvements that enhance vehicular capacity at isolated intersections located outside of the immediate project area that are of little benefit to the overall roadway system, the CHSPADP will provide the mechanism for the implementation and funding of improvements to the transportation system in the immediate area of the project site. The CHSPADP includes improvements to primary access points to the freeway system and major roadways, new connections to existing transit services, and the enhancement of pedestrian and bicycle facilities to serve the proposed project as well as the existing neighborhoods in the project area and reduce further demand on other local roadways.

Although the project is not proposing to mitigate the regional freeway impacts or the selected signalized intersections described above, the project is implementing an extensive list of improvements that reduce the significant traffic impacts and provide transportation options for the project. These improvements are intended to make the most of the unique transit opportunities afforded the site.

Right-of-way, encroachment permits, and/or easements from public agencies/jurisdictions may be required for some of the improvements described below. Private property would only need to be acquired to allow access to the pedestrian/bicycle overcrossing of the Caltrain tracks.

As other properties within the CHSP come forward for development, it is expected that they may result in additional impacts at the identified intersections. Subsequent traffic analyses would be required to determine participation in the ADP. Each of the ADP improvements and benefits of their implementation is discussed below.

### **Curtner Avenue Corridor Improvements**

Curtner Avenue serves as a major east-west arterial that provides access to SR 87 and Almaden Expressway which are primary links to employment lands north of the project area. The Curtner Avenue interchange with SR 87 serves as a major access point from the project area to north and south San Jose.

The addition of project traffic at the intersection of Curtner Avenue and Communications Hill Boulevard would result in a significant impact. Mitigation measures will be implemented to reduce impacts to a less than significant level at the Curtner Avenue and Communications Hill Boulevard intersection as part of this ADP. Other improvements are included as part of the ADP to reduce other impacts of the project, as described below.

In addition, project traffic will contribute to deficient operations at the Curtner Avenue and SR 87 northbound on-ramp. Thus, improvements along the Curtner Avenue corridor that will provide additional capacity to serve project traffic, as well as alleviate congestion along other roadways and intersections in the project area, were identified by the City and will be included as part of the ADP.

In particular, the planned improvements to the SR 87 ramps are expected to reduce congestion and operational issues currently experienced at both the Narvaez Avenue/Capitol Expressway and Curtner Avenue on-ramps. The Envision 2040 General Plan identifies the need to widen Curtner Avenue between Communications Hill Boulevard and SR 87 from its existing four to six lanes. The CHSPADP will provide for the widening of Curtner Avenue in the westbound direction along with specific intersection improvements as described below.

#### **ADP Improvement 1: Widen Curtner Avenue to Five Lanes Between Communications Hill Boulevard and the Almaden Expressway Southbound Off-Ramp**

- Remove existing four-foot wide median and replace with two-foot wide median across existing Curtner Avenue Bridge over the railroad tracks.
- Re-stripe westbound Curtner Avenue lanes from Communications Hill Boulevard to SR 87 on-ramp to accommodate additional through lane.
- Convert westbound lane from Communications Hill Boulevard into dedicated right-turn lane at SR 87 northbound on-ramp.
- Existing Curtner Avenue Bridge over the railroad tracks to remain in place and proposed improvements shall occur within the existing right-of-way.
- Re-stripe Curtner Avenue under SR 87 overpass to improve alignment.
- Modify existing median.
- Maintain existing Class II bicycle lane along Curtner Avenue by restriping it between Communications Hill Boulevard and the Curtner Avenue Bridge over the railroad tracks.

#### **ADP Improvement 2: Intersection of Communications Hill Boulevard and Curtner Avenue**

- Add second westbound left-turn lane from Curtner Avenue onto southbound Communications Hill Boulevard upon modification of existing median.
- Restripe existing westbound right-turn lane onto northbound Communications Hill Boulevard to accommodate an additional through lane upon removal of existing pork chop islands.
- Remove pork chop islands, reduce radius returns on both north and south sides of Curtner Avenue, modify traffic signal including new poles, mast arms, pedestrian facilities, and restriping.

**ADP Improvement 3: Intersection of SR 87 Northbound Off-Ramp and Curtner Avenue**

- Modify traffic signal including new mast arm poles, upgrades to pedestrian facilities, and restriping.
- Right-of-way on the south side to be acquired by the City from Caltrans.

**ADP Improvement 4: SR 87 Northbound On-Ramp at Curtner Avenue**

- Add second eastbound left-turn lane from Curtner Avenue onto the SR 87 northbound on-ramp.
- Modify the existing median island at the SR 87 and Curtner Avenue intersection.
- Extend the existing HOV lane on the on-ramp back to Curtner Avenue and provide additional mixed-flow lane on the ramp from Curtner to metering light for a total of three lanes on the ramp. This may require additional right-of-way on the east side of SR 87 between Unified Way and the metered on-ramp for approximately 200' feet.
- Add Class I bicycle facility to shoulder along Unified Way. Construct 10-foot paved trail with two-foot shoulders from existing path terminus at bus yard driveway to the corner of Unified Way and Curtner Avenue.
- Install traffic signal at Unified Way at Bus Yard
- CALTRANS to relinquish Unified Way and right-of-way along Curtner Avenue to City of San Jose.
- These improvements require an encroachment permit from CALTRANS

**Capitol Expressway/Narvaez Avenue/SR 87 On/Off Ramps**

The SR 87 freeway ramps at Capitol Expressway and Narvaez Avenue serve as the primary freeway access point and link between the residential land uses in the project area with employment centers north of the project area. The SR 87 on-ramp at Narvaez Avenue currently experiences lengthy queues during the AM peak hour when ramp metering is active.

Although it is projected that the primary freeway access point for the proposed project will be provided by the Curtner Avenue interchange with SR 87 and that the project traffic will have a minimal effect on the SR 87 ramps at Narvaez Avenue, the developer has voluntarily included improvements to this interchange as part of its application for development to the City to alleviate other traffic issues in the vicinity of the project because not all project impacts could be mitigated. These improvements are included in this policy. Improvements have been identified to increase vehicular queue storage at the Narvaez on-ramp in an effort to alleviate operational issues near the freeway ramps. The planned improvements in the vicinity of the Capitol Expressway/Narvaez Avenue/SR 87 On/Off Ramps are discussed below.

**ADP Improvement 5: Improvement to the SR 87 On-Ramp/Narvaez Avenue Corridor**

- Widen Narvaez Avenue from Capitol Expressway northerly to the SR 87/Narvaez on/off ramps to extend two existing northbound through lanes on Narvaez Avenue to the SR 87 northbound on/off ramps.
- Reconfigure the intersection at the SR 87 northbound on/off ramps to improve the intersection operations, queuing for both northbound and southbound Narvaez Avenue, and construction of a retaining wall adjacent to the existing VTA parking lot.
- Modify full traffic signal including improved pedestrian and bike facilities at the SR 87 on/off ramps.
- Modify traffic signal at the intersection of Capitol Expressway and Narvaez Avenue.
- These improvements require an encroachment permit from the County and Caltrans.
- These improvements may require additional right-of-way between the SR 87 ramps and Capitol Expressway at the VTA parking lot (approximately ½ acre).

**Public Transit/Pedestrian/Bike Improvements**

Although the project area is served by several major public transit lines (Caltrain and VTA bus lines and LRT), the project site itself is not served directly by any transit services. In addition, there are no existing

pedestrian/bicycle links between the project site and other existing pedestrian/bicycle and transit facilities in the area. The CHSPADP includes several improvements to existing, as well as the construction of new, non-auto facilities with the intent to promote and encourage the use of multi-modal travel options. The identified improvements are consistent with the Envision 2040 General Plan goals and policies that are dedicated to the enhancement of the transportation infrastructure, including public transit and pedestrian/bike facilities. The Transportation Policies contained in the General Plan create incentives for non-auto modes of travel while reducing the use of single-occupant automobile travel as generally described below:

- Through the entitlement process for new development, fund needed transportation improvements for all transportation modes, giving first consideration to improvement of bicycling walking, and transit facilities.
- Give priority to the funding of multimodal projects to provide the most benefit to all users of the transportation system.

Thus, the implementation of the improvements discussed below are intended to reduce the identified project impacts to the roadway system by providing the project site with viable connections to surrounding pedestrian/bike and transit facilities and provide for a balanced transportation system as outlined in the Envision 2040 General Plan goals and policies..

**ADP Improvement 6: Bicycle and Pedestrian Facility Improvements (Unified Way to Masonic Drive)**

- Construct a Class I bicycle facility (10 feet paved with two-foot shoulders) from trail terminus at Unified Way southerly crossing at SR 87/Curtner Avenue northbound off/on ramp intersection and continuing along the east side of SR 87 ending at Millpond Drive/Masonic Drive.
- Construct a Class I bicycle/pedestrian facility (10 feet paved with two-foot shoulders) from Millpond Drive south along the east side of SR 87 to Carol Drive. This will require the construction of a retaining wall along the east side of the trail.

**ADP Improvement 7: Bicycle and Pedestrian Facility Improvements (Azores Street to Capitol Expressway)**

- Stripe Class II bike lanes along Narvaez Avenue from existing trail terminus at Azores Street/Helzer Road southerly within the existing right-of-way on Narvaez Avenue. Continue the Class II bicycle lane along the newly constructed/widened Narvaez Avenue from the SR 87 off/on ramps to Capitol Expressway.
- The traffic signal at Narvaez Avenue and the SR 87 on/off ramps will be modified to include improved bike/pedestrian crossing.
- This will require right-of-way from the existing VTA parking lot on the west side of Narvaez Avenue.

**ADP Improvement 8: CALTRAIN Pedestrian/Bicycle Connection along Monterey Highway**

Access from the Communications Hill 2 project site to the Capitol Caltrain Station on the east side of the railroad tracks adjacent to Monterey Road can be acquired by way of three options. These options were developed because property would need to be obtained from private property owners. Option #1 assumes the crossing would located north of the existing Capitol Caltrain Station. The overcrossing location for Options #2 and #3 would be approximately the same; adjacent to or very near the existing Station. The design of the crossing itself would be the same regardless of the access location. These options are generally described below.

**Option #1 Alignment**

- Construct approximately 400 linear feet of sidewalk or pathway from the project site to the western landing of the future overcrossing to be located north of the existing Capitol Caltrain Station.

- Construct a pedestrian/bicycle overcrossing between the end of the sidewalk/pathway and the existing sidewalk on the east side of the railroad tracks. The sidewalk on the east side of the railroad tracks along Monterey Road would be utilized to access the Station.
- Requires right-of-way (easement) from at least one private property owner.
- Requires coordination/permit from the Joint Powers Board

#### **Option #2 Alignment**

- Construct approximately 1,200 linear feet of pathway or trail from the project site to the western landing of the overcrossing to the Caltrain Station. A portion of this trail would run along the east side of the railroad tracks.
- Construct a pedestrian/bicycle overcrossing between the end of the pathway/trail and the Station.
- Requires easement from at least two private property owners.
- Requires coordination/permit from the Joint Powers Board.

#### **Option #3 Alignment**

- Utilize existing public streets and sidewalks south of the project site to the extent possible to access the future overcrossing. This would require the construction of approximately 2,200 linear feet of new sidewalks from the project site along Hillcap and Hillsdale Avenues and Granite Rock Way. At the terminus of Granite Rock Way, an approximately 400-foot long pathway/trail would be constructed to the western landing of the overcrossing. Construct a pedestrian/bicycle overcrossing between the end of the pathway/trail and the Station.

### ***Background Plus Project Freeway Segment Level of Service Analysis***

The results of the freeway segment analysis show that, based on the CMP freeway segment criteria, the project will have a significant impact on mixed-flow lanes on 10 directional freeway segments and HOV lanes on two directional freeway segments during at least one peak hour.

The Valley Transportation Authority *VTP 2035* identifies improvements to regional facilities, including freeways, for which a regional funding plan could be used to fund. The Silicon Valley Express Lanes Program, is identified in the *VTP 2035* and will convert existing carpool lanes and add new lanes to provide congestion relief throughout Santa Clara County. The Silicon Valley Express Lanes Program and *VTP 2035* identify improvement of the following impacted freeway segments:

- SR 87 Express Lanes, between SR 85 and US 101
- I-280 Express Lanes, between US 101 and Leland Avenue
- I-680 Express Lanes, between Calaveras Boulevard and US 101

The project along with other projects within Santa Clara County could contribute towards the funding of the improvements. However, full mitigation of significant project impacts on freeway segments is not feasible for an individual development project to bear responsibility for implementing such extensive transportation system improvements. Therefore, significant impacts on the directional freeway segments identified above must be considered significant and unavoidable.

As discussed above, the CHSPADP includes several improvements to existing as well as the construction of new non-auto facilities with the intent to promote and encourage the use of multi-modal travel options to reduce the use of single-occupant automobile travel. The implementation of the improvements are intended to reduce the identified project impacts to the roadway system, including freeways, by providing the project site with viable connections to surrounding pedestrian/bike and transit facilities.

## Other Transportation Issues

### *Intersection Operations Analysis*

The following intersections would have inadequate queue storage capacity under project conditions.

#### (13) Almaden Expressway and Foxworthy Avenue

*Recommendation:* The recommended improvement for the intersection of Almaden Expressway and Foxworthy Avenue is to extend the left-turn lanes on the southbound approach to provide an additional 350 feet of total storage capacity to accommodate the projected queues. The improvement will require removal and reconstruction of the median island along the southbound leg of the intersection and restriping of the lanes.

#### (22) Communications Hill Boulevard and Curtner Avenue

*Recommendation:* The improvements for the intersection of Communications Hill Boulevard and Curtner Avenue included in the ADP will provide a second left-turn lane on the westbound approach to provide a total queue storage capacity of 650 ft. The improvement includes the removal of the “pork chop” islands at the southern side of the intersection, relocation of the existing traffic signal, and restriping of the lanes. There are no further feasible improvements to implement on the northbound approach to the intersection. Implementation of the ADP will improve operational deficiencies at this intersection.

#### (32) Vistapark Drive and Capitol Expressway

*Recommendation:* The recommended improvements for the intersection of Vistapark Drive and Capitol Expressway is to extend the left-turn lanes on the southbound and eastbound approaches by 25 feet to accommodate the projected queues. These improvements will require removal and reconstruction of median islands along the north and west legs of the intersection and restriping of the lanes. The City has the discretion to include this improvement in the ADP.

#### (33) Snell Avenue and Capitol Expressway

*Recommendation:* The recommended improvements for the intersection of Snell Avenue and Capitol Expressway is to provide a third left-turn lane on the southbound approach to provide a total queue storage capacity of 975 ft. The improvement will require right-of-way from adjacent properties, removal of the “pork chop” islands at the northern and southern sides of the intersection, relocation of the existing traffic signal, and restriping of the lanes. These improvements are not currently feasible due to a lack of right-of-way.

### *Unsignalized Intersection Analysis (Traffic Signal Warrants)*

Peak hour signal warrants were checked at the Old Hillsdale Avenue and Hillsdale Avenue unsignalized study intersection under each of the scenarios analyzed. The results indicate that the unsignalized study intersection of Old Hillsdale Avenue and Hillsdale Avenue intersection is projected to have traffic volumes that meet the thresholds that warrant signalization under background plus project.

### *Freeway On-Ramp Analysis*

An analysis of the freeway on-ramps serving the project site was performed in order to identify potential project impacts on queue lengths and ramp operations. The project will be served by two freeway interchanges: SR 87 and Narvaez Avenue/Capitol Expressway and SR 87 and Curtner Avenue.

### **SR 87 Northbound On-Ramp and Narvaez Avenue**

The project is not projected to add a significant amount of AM peak hour trips to the SR 87 northbound on-ramp from northbound Narvaez Avenue and will result in the reduction of trips by 65 AM peak hour trips from southbound Narvaez Avenue. The reduction of AM peak-hour trips at the SR 87 northbound on-ramp from Narvaez Avenue is due to the redistribution of traffic created by the construction of the Communications Hill Boulevard bridge and connection to Curtner Avenue. A portion of the traffic that is currently using the SR 87 Narvaez ramp is expected to change travel patterns and instead utilize the SR 87 northbound on-ramp at Curtner Avenue. Once a connection from the project site to Curtner Avenue is built, the majority of project traffic bound for northbound SR 87 would use the freeway on-ramp at Curtner Avenue, since it provides for shorter travel distances when compared to the SR 87 ramp at Narvaez Avenue.

Improvements are planned as part of the CHSPADP, as described in Chapter 5, at the SR 87 northbound on-ramp from Narvaez Avenue. The improvements will provide for additional vehicular storage capacity, improve operations at the Narvaez Avenue and SR 87 ramps intersection, and provide new and enhanced existing pedestrian and bicycle facilities near the ramps. However, delays would continue to be experienced during the AM peak hour at the northbound SR 87 on-ramp. The ramp operations and delays are dictated by the ramp meter service rate. In order to reduce delay time at the ramp, the meter would have to be adjusted to provide a higher service rate and traffic flow onto the freeway. The proposed improvements will not change the existing meter service rates which are controlled by Caltrans not the City of San Jose.

### **SR 87 Northbound On-Ramp and Curtner Avenue**

At the SR 87 northbound on-ramp at Curtner Avenue, the project is projected to add approximately 225 trips to the freeway on-ramp from westbound Curtner Avenue. The additional traffic will result in an increase of the projected queue length by approximately 45 vehicles and cause the wait time at the ramp to increase. The metering rate at the Curtner Avenue northbound on-ramp is currently three times longer than the rate at the Narvaez Avenue northbound on-ramp. The analysis of the freeway ramp assumes that the current metering rate at the SR 87 northbound on-ramp from Curtner Avenue would be increased to serve the increase in demand at the ramp and balance the usage of the Narvaez Avenue and Curtner Avenue ramps. Caltrans controls the metering rate on freeway ramps. Presumably the existing metering rate at the Curtner Avenue northbound on-ramp is based on the current demand which is 50% less than that at the Narvaez Avenue northbound on-ramp. The Narvaez Avenue northbound on-ramp currently serves approximately 900 vehicles during the AM peak hour compared with only 460 vehicles at the Curtner Avenue northbound on-ramp.

Improvements are planned as part of the CHSPADP, as described in Chapter 5, at the SR 87 northbound on-ramp from Curtner Avenue. The improvements include the addition of a second mixed-flow lane and extension of the existing HOV lane on the northbound ramp. The addition of a third lane to the on-ramp would provide an additional 700 ft. of queue storage capacity from Curtner Avenue to the existing ramp meter location. In addition to the ramp improvements, the ADP will require the project to widen the westbound direction of Curtner Avenue from two to three lanes from Communications Hill Boulevard to the SR 87 northbound ramps to provide additional storage capacity to serve the projected westbound queue length under project conditions.

## **Roadway Segment Analysis**

A capacity analysis was performed for a select set of primary roadways serving the project area. Traffic operations for the roadways were evaluated by comparing the average daily volumes (ADT) to the threshold capacities for various roadway types identified in the *Highway Capacity Manual, Transportation Research Board 2000 (HCM 2000)*. The HCM 2000 thresholds are based on the local roadway functional classification and these values provide a planning-level analysis of the relative traffic load and approximate capacity on a particular roadway. It is important to note that daily volume thresholds are used for planning purposes and traffic during the peak commute periods may result in worse operations than illustrated by the daily LOS. The City of San Jose does not have a formally adopted roadway

segment operating standard. Thus, for the purposes of this analysis, LOS D was used as a guideline for the evaluation of daily segment volumes.

The ADT level of service analysis indicates that the segment of Curtner Avenue between SR 87 and Communications Hill Boulevard is projected to have ADT volumes that exceed the thresholds for LOS D operations. The projected ADT and resulting levels of service, indicate the need to widen Curtner Avenue between SR 87 and Communications Hill Boulevard. The CHSPADP, as described in Chapter 5, will require the project to widen westbound Curtner Avenue from two to three lanes between Communications Hill Boulevard and SR 87. The remaining roadway segments evaluated are projected to have ADT volumes that fall below the HCM 2000 maximum ADT thresholds for operations of LOS D.

### ***Pullman Way Extension***

The extension of the existing Pullman Way to provide an additional access point to the project area was identified within the Communications Hill Specific Plan. The Pullman Way extension was planned to connect Communications Hill Boulevard (along the northeast part of the project site) with Monterey Road to the east of the project area.

The traffic model was utilized to assign project conditions traffic volumes without and with the Pullman Way extension as analyzed in this study. A comparison of intersection level of service analysis results without and with the planned Pullman extension indicates that there is no significant benefit to providing the extension in regards to improved intersection levels of service. However, operational issues such as lengthy vehicle queues at the other primary access points to the general Communications Hill area were identified that may be partially alleviated with the Pullman Way extension.

However, the Pullman way extension would not create significant improvement in overall traffic conditions and circulation on the roadway system. Furthermore, construction of the Pullman Way extension would require significant cut-and-fill, construction of several large retaining walls, and a travel route that is circuitous due to the change in grades that are required to construct this connection. The proposed connections from the project area to Capitol Expressway and Curtner Avenue, with the identified improvements, would accommodate the projected traffic volumes.

### ***Transit, Pedestrian and Bicycle Analysis***

The project site is located between two major transit opportunities. The Capitol and Curtner LRT stations are located along SR 87 approximately one mile from the project site. The Capitol Caltrain station is located at the intersection of Monterey Road and Fehren Drive. Currently there is no direct access point to the Capitol Caltrain Station from the project site. Access to the station requires the use of the Capitol Expressway overcrossing of Monterey Highway and a route that is approximately 2.25 miles and includes the use of Snell Avenue, Capitol Expressway, and Monterey Highway. In addition, the project site is not served directly by any bus services. The nearest bus stops are located at the base of the hill near the intersections of Communications Hill Boulevard/Curtner Avenue and Capitol Expressway/Vistapark Drive.

Currently, there are no existing pedestrian/bike links between the project site and other existing pedestrian/bike and transit facilities in the area. The CHSPADP, as described in detail in Chapter 5, will require the project to construct new non-auto facilities as well as enhance existing facilities, as previously described. The improvements are intended to promote and encourage the use of multi-modal travel options and reduce the identified project impacts to the roadway system. The improvements will provide the project site with improved connections to surrounding pedestrian/bike and transit facilities and a balanced transportation system as outlined in the Envision 2040 General Plan goals and policies.

# 1. Introduction

---

The purpose of this traffic study is to evaluate the traffic impacts associated with the proposed buildout of the Communications Hill Specific Plan area. The entire Communications Hill Specific Plan area comprises approximately 900 acres of hilly land located approximately four miles south of downtown San José. The Plan Area is bounded by Curtner Avenue to the north, Monterey Road to the east, Capitol Expressway, Snell Avenue, and Hillsdale Avenue to the south, and Guadalupe Freeway (SR 87) to the west. The Oak Hill Cemetery is located adjacent to the northeastern boundary of the Plan area.

The proposed project site is within the Specific Plan Area near the top of the hill adjacent to the existing KB Home Tuscany Hills development. The project site is generally bounded by the Caltrain/Union Pacific railroad tracks on the east, Old Hillsdale Avenue to the south, the Tuscany Hills development to the west, and the Millpond and Dairy Hill neighborhoods to the north. The site is vacant and comprised primarily of grassland. The residential/commercial portion of the site is approximately 79 gross acres, while the industrial property is approximately 55 gross acres. The project site location and the surrounding study area are shown on Figure 1. The project site plan is shown on Figure 2.

## Scope of Study

The study determines the traffic impacts of the proposed project on the key intersections and freeway segments in the vicinity of the project area during the weekday AM and PM peak hours. The impacts of the development were evaluated following the standards and methodologies set forth by the City of San Jose and the Congestion Management Program (CMP). The study also includes an operations analysis, based on vehicle-storage requirements at select intersections and on-site circulation analysis, which includes level of service analysis and vehicle-storage requirements at planned intersections and roadways on the project site.

Traffic conditions at all of the study intersections and freeway segments were analyzed for the weekday AM and PM peak hours. The weekday AM peak hour of traffic is generally between 7:00 and 9:00 AM and the weekday PM peak hour is typically between 4:00 and 6:00 PM. It is during these periods that the most congested traffic conditions occur on a typical weekday. Traffic conditions were evaluated for the following scenarios:

- Scenario 1:** *Existing Conditions.* Existing AM and PM peak hour traffic volumes were obtained from the City of San Jose and supplemented with new manual turning-movement counts conducted in September 2012 and March 2013.
- Scenario 2:** *Existing Plus Project Conditions.* Existing plus project peak hour traffic volumes were estimated by adding forecasted traffic growth due to the proposed project to existing traffic volumes. Forecasted traffic volumes due to the proposed project were developed with the use of the City's traffic forecasting model CUBE. The forecasted traffic volumes consist of the traffic estimated to be generated by the proposed project development along with adjustments to existing traffic volumes due to changes in traffic patterns. The net forecasted traffic growth was applied to existing traffic volumes to produce existing

**Figure 1**  
**Site Location and Study Area Boundary**

Figure 2  
Site Plan

plus project conditions volumes. Existing plus project conditions were evaluated relative to existing conditions in order to determine the effects the project would have on the existing roadway network.

**Scenario 3:** *Background Conditions.* Background traffic volumes were estimated by adding to existing peak hour volumes the projected volumes from approved but not yet completed developments. The added traffic from approved but not yet completed developments was provided by the City of San Jose in the form of the Approved Trips Inventory (ATI). Background conditions represent the baseline conditions to which project conditions are compared for the purpose of determining project impacts.

**Scenario 4:** *Background Plus Project Conditions.* The City's CUBE model was used to forecast traffic growth associated with the proposed development levels. The forecasted traffic volumes consist of the traffic estimated to be generated by the proposed project development along with adjustments to existing traffic volumes due to changes in traffic patterns. The net forecasted traffic growth was applied to background traffic volumes to produce background plus project conditions volumes. Background plus project conditions were evaluated relative to background conditions in order to determine potential project impacts, according to the City of San Jose Level of Service (LOS) Policy. The City of San Jose LOS Policy is the adopted established threshold for California Environmental Quality Act (CEQA).

## Methodology

This section presents the methods used to determine the traffic conditions for each scenario described above. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards. Traffic studies for site-specific development projects typically evaluate the effects of project traffic on a near-term (less than 5-years) basis by manually layering project traffic on to existing traffic data. However, unlike the near-term analysis methodology, this analysis utilizes a traffic-forecasting model to project long-term traffic growth since the proposed development encompasses a large area and will be built over a long period. The traffic-forecasting model has the ability to project the diversion of traffic and change in traffic patterns due to roadway system changes as well as large land use changes similar to those proposed by the project.

### Data Requirements

The data required for the analysis were obtained from previous traffic studies, new traffic counts, the City of San Jose, the CMP Annual Monitoring Report, and field observations. The following data were collected from these sources:

- existing traffic volumes
- lane configurations
- signal timing and phasing
- average speeds on freeway segments
- a list of approved and planned projects

### The CUBE Traffic Model

The City's traffic forecasting model utilizes CUBE software which reflects the refinements in knowledge and capacity associated with traffic modeling in recent years. Compared to the TRANPLAN model used in the past, the CUBE model is both more powerful and more detailed in the information it can provide. The CUBE model can evaluate conditions during AM and PM one-hour peak periods, and for AM and PM four-hour peak periods, the latter option reflecting the dispersion of traffic during peak commute periods. Transit can be evaluated during peak and off-peak periods.

The City of San José's traffic forecasting model was developed to help the City project peak hour

traffic impacts attributable to changes proposed to the City's General Plan. The model uses the CUBE transportation planning software system and is consistent with the structures of the Metropolitan Transportation Commission's (MTC) BAYCAST regional model and The Santa Clara Valley Transportation Authority (VTA's) VTP 2030 model. The San José model includes the four elements traditionally associated with models of this kind. These elements include:

- Trip Generation,
- Trip Distribution,
- Mode of Travel, and
- Traffic Assignment.

The fundamental structure of the model includes a computer readable representation of the street system (roadway network) that defines street segments (links) identified by end points (nodes). Each roadway link is further represented by key characteristics (link attributes) that describe the length, travel speeds, and vehicular capacity of the roadway segment. Small geographic areas (traffic analysis zones, also called TAZs) are used to quantify the planned land use activity throughout the City's planning area. The boundaries of these small geographic areas are typically defined by the modeled street system, as well as natural and man-made barriers that have an effect on traffic access to the modeled network. Within the City's planning area, the TAZs are small in size. In outlying areas of the modeled network (such as in distant counties), the TAZs will typically be larger since the areas are less populated, there is little planned growth, and the existing and planned transportation system is minimal.

Mass transit systems are represented in the model by transit networks that are also identifiable by links and nodes. Unlike the roadway network, the key link attributes of a transit link are operating speed and headways – elapsed time between successive transit services. Transit stops and “dwelling times” (the time allowed for passengers embarking and disembarking transit vehicles) are described as transit node attributes. Transit networks are further grouped by type of transit (rail versus bus) and operator (VTA bus versus AC Transit bus). Transit accessibility for each TAZ is evaluated by proximity to transit stops or stations, and the connectivity of transit lines to destinations. The accessibility and efficiency of the transit system affects the forecasted transit usage and in turn results in decreases or increases in automobile usage.

The socioeconomic data for each TAZ in the model includes information about the number of households (stratified by household income and structure type), population, average income, age distribution, and employment (stratified by groupings of Standard Industrial Codes). Both the number of workers per household and the auto ownership within a TAZ are calculated based on these factors, as well as the types and densities of residences. The model projects trip generation rates and the traffic attributable to residents and resident workers, categorized by trip purposes, using a set trip generation formula. The trip generation formulae were originally created by the Metropolitan Transportation Commission in 1997 based on 1990 U.S. Census data and 1994 San Francisco Bay Region Travel Survey, and are calibrated to 2000 U.S. Census data to more accurately reflect travel frequency for Bay Area residents.

Travel times within and between TAZs (intra-zonal and inter-zonal, and terminal times) are developed from the network being modeled. Travel times within zones (intra-zonal travel times) are derived for each zone based on half its average travel time to the nearest three adjacent zones. Time to walk to and from the trip maker's car (terminal times) are also added.

The projected daily trips are distributed using a standard gravity model and friction factors calibrated for the modeling region, which presently consists of 13 counties. Gravity models forecast travel based on trip type, distance, and time. The model accounts for factors that affect travel time. Generally, as time to travel between origin and destination increases, the less likely it is that trips of certain lengths will be made. Shares of transportation modes are then assigned to the daily trip distributions (or trip tables) utilizing a nested-Logit methodology. The nested-Logit methodology models the relationship between a dependent variable and one or more independent variables.

The City of San José CUBE Model is capable of estimating up to 7 modes of transportation – auto drive alone, auto shared ride 2+ occupants, auto shared ride 3+ occupants, rail transit, bus transit, bicycle, and walk. For school trip purposes, auto driver and auto passenger are assumed for automobile travel. Time-of-day factors and directionality factors are then applied to automobile trips occurring during the AM peak hour, AM 3-hour peak period, PM peak hour, and PM 3-hour peak period before the traffic is assigned to the roadway networks. The assignment of the trip tables to the roadway network uses a route selection procedure based on minimum travel time paths (as opposed to minimum travel distance paths) between TAZs and is done using a capacity-constrained user equilibrium-seeking process. This capacity-constrained traffic assignment process continually adjusts to seek a balance in a roadway system that is capacity constrained and enables the model to reflect diversion of traffic around congested areas of the overall street system.

### **Model Forecasts**

Land use data was prepared and traffic forecasts completed by Hexagon Transportation Consultants for the proposed project using the City of San Jose's CUBE traffic forecasting model.

### **Turn-Movement Adjustments**

Adjustments were made to the model to calibrate forecasted volumes with actual travel patterns and use of roadways based on current traffic conditions. The adjustment process begins by comparing and adjusting base model forecasts (year 2008 forecasts representing existing conditions) with existing traffic counts. By adjusting the base model forecasts with existing volumes, model projections are calibrated with actual travel patterns and use of proper facilities. Once the base model forecasts are calibrated, future model forecasts are developed for the study scenarios. These are all considered "raw" model volume forecasts, which on their own do not represent future volume conditions, but are simply used to forecast growth and travel pattern changes expected in the future.

To obtain the final traffic volume forecasts, raw model volume forecasts in conjunction with existing count data are used. Future traffic volume forecasts are developed by adding to the existing traffic count data the projected growth between the base (year 2008) and the project condition model volume forecasts. The traffic growth for each of the study intersections was calculated by taking the difference between the Base Year forecasts and the project conditions traffic forecasts for each of the intersections. The land use data, roadway network, and counts used in the model base year reflect April and May 2008 conditions.

### ***Signalized Intersection Analysis***

Traffic conditions at the study intersections were evaluated using level of service (LOS). *Level of Service* is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays. The analysis methods are described below.

All study intersections are located in the City of San Jose and are subject to the City of San Jose Level of Service standards. The City of San Jose level of service methodology is TRAFFIX, which is based on the 2000 *Highway Capacity Manual* (HCM) method for signalized intersections. TRAFFIX evaluates signalized intersections operations on the basis of average control delay time for all vehicles at the intersection. Since TRAFFIX is also the CMP-designated intersections level of service methodology, the City of San Jose methodology employs the CMP defaults values for the analysis parameters. The City of San Jose level of service standard for signalized intersections is LOS D or better. The only difference between the San Jose and CMP analyses is that project impacts are determined on the basis of different level of service standards –the CMP level of service standard for signalized intersections is LOS E or better. The correlation between average delay and level of service is shown in Table 1.

### **Study Intersections**

The study includes an analysis of AM and PM peak-hour traffic conditions for 82 signalized intersections within the City of San Jose. The AM peak hour of traffic is generally between 7:00 and 9:00 AM, and the

**Table 1**  
**Signalized Intersection Level of Service Definitions Based on Control Delay**

| Level of Service | Description                                                                                                                                                                                                         | Average Control Delay Per Vehicle (Sec.) |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| <b>A</b>         | Operations with very low delay occurring with favorable progression and/or short cycle lengths.                                                                                                                     | Up to 10.0                               |
| <b>B</b>         | Operations with low delay occurring with good progression and/or short cycle lengths.                                                                                                                               | 10.1 to 20.0                             |
| <b>C</b>         | Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.                                                                              | 20.1 to 35.0                             |
| <b>D</b>         | Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.                             | 35.1 to 55.0                             |
| <b>E</b>         | Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay. | 55.1 to 80.0                             |
| <b>F</b>         | Operation with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths.                                                                                  | Greater than 80.0                        |

Source: Transportation Research Board, 2000 Highway Capacity Manual. (Washington, D.C., 2000)

PM peak hour is typically between 4:00 and 6:00 PM. It is during these periods that the most congested traffic conditions occur on an average day.

The study intersections were selected based upon the estimated number of projected project trips to be added to intersections (10 or more trips per lane per hour). Any intersections outside of the study area, including those in other jurisdictions, to which the project would not add 10 or more trips per lane per hour were not studied because the addition of project traffic would not be a sufficient amount to result in the degradation of intersection levels of service. The study area and intersections are shown in Figure 3 and are listed below:

\* CMP Designated Intersection

### **Significant Intersection Impact Criteria**

#### **City of San Jose Definition of Significant Intersection Impacts**

The project is said to create a significant adverse impact on traffic conditions at a signalized intersection in the City of San Jose if for either peak hour:

1. The level of service at the intersection degrades from an acceptable LOS D or better under background conditions to an unacceptable LOS E or F under project conditions, or
2. The level of service at the intersection is an unacceptable LOS E or F under background conditions and the addition of project trips causes both the critical-movement delay at the intersection to increase by four or more seconds and the demand-to-capacity ratio (V/C) to increase by .01 or more.

An exception to this rule applies when the addition of project traffic reduces the amount of average stopped delay for critical movements (i.e. the change in average stopped delay for critical movements is negative). In this case, the threshold of significance is an increase in the critical V/C value by .01 or more.

A significant impact by City of San Jose standards is said to be satisfactorily mitigated when measures are implemented that would restore intersection level of service to background conditions or better.

#### **CMP Conformance**

The CMP standard for acceptable level of service at a CMP intersection is LOS E or better. However, the City of San Jose LOS D standard and impact criteria is applied to CMP intersections located within City of San Jose limits.

### ***Freeway Segment Analysis***

As prescribed in the CMP technical guidelines, the level of service for freeway segments is estimated based on vehicle density. Density is calculated by the following formula:

$$D = V / (N \cdot S)$$

Where:

D= density, in vehicles per mile per lane (vpmpl)

V= peak hour volume, in vehicles per hour (vph)

N= number of travel lanes

S= average travel speed, in miles per hour (mph)

The vehicle density on a segment is correlated to level of service as shown in Table 2. The CMP specifies that a capacity of 2,300 vehicles per hour per lane (vphpl) be used for mixed-flow lane segments that are

**Table 2**  
**Freeway Level of Service Based on Density**

| Level of Service | Description                                                                                                                                                                                                                           | Density (vehicles/mile/lane) |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| A                | Average operating speeds at the free-flow speed generally prevail. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream.                                                                   | 0-11                         |
| B                | Speeds at the free-flow speed are generally maintained. The ability to maneuver within the traffic stream is only slightly restricted, and the general level of physical and psychological comfort provided to drivers is still high. | >11-18                       |
| C                | Speeds at or near the free-flow speed of the freeway prevail. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more vigilance on the part of the driver.                              | >18-26                       |
| D                | Speeds begin to decline slightly with increased flows at this level. Freedom to maneuver within the traffic stream is more noticeably limited, and the driver experiences reduced physical and psychological comfort levels.          | >26-46                       |
| E                | At this level, the freeway operates at or near capacity. Operations in this level are volatile, because there are virtually no usable gaps in the traffic stream, leaving little room to maneuver within the traffic stream.          | >46-58                       |
| F                | Vehicular flow breakdowns occurs. Large queues form behind breakdown points.                                                                                                                                                          | >58                          |

Source: Santa Clara County 2004 CMP (Based on the *Highway Capacity Manual (2000)*, Washington, D.C.).

three lanes or wider in one direction, and a capacity of 2,200 vphpl be used for mixed-flow lane segments that are two lanes wide in one direction. A capacity of 1,800 vphpl was used for high occupancy vehicle (HOV) lanes. The CMP defines an acceptable level of service for freeway segments as LOS E or better.

### Study Freeway Segments

Freeway segments to be included in the analysis were selected based on their proximity to the project area and include 56 directional segments along SR 87, US 101, I-280, and I-680. Existing levels of service on each of the freeway study segments were identified based on the 2012 CMP monitoring report.

### **CMP Definition of Significant Freeway Segment Impacts**

A project is said to create a significant adverse impact on traffic conditions on a CMP freeway segment if for either peak hour:

1. The level of service on the freeway segment is an unacceptable LOS F under project conditions, and
2. The number of project trips on that segment constitutes at least one percent of capacity on that segment.
3. The level of service on the freeway segment degrades from an acceptable LOS under existing conditions to an unacceptable LOS F under project conditions.

A significant impact by CMP standards is said to be satisfactorily mitigated when measures are implemented that would restore freeway conditions to LOS E or better.

## Report Organization

The remainder of this report is divided into six chapters. Chapter 2 describes existing conditions in terms of the existing roadway network, transit service, and existing bicycle and pedestrian facilities. Chapter 3 describes the method used to estimate project traffic and the resulting traffic conditions expected under Existing plus Project conditions. Chapter 4 presents the intersection levels of service under background conditions with the addition of traffic from approved development projects. Chapter 5 presents traffic conditions and potential project impacts and recommended mitigation measures under background plus project conditions. Chapter 6 presents the analysis of other transportation related issues, including intersection operations and signal warrants. Chapter 7 presents the conclusions of the traffic impact analysis.

## 2. Existing Conditions

---

This chapter describes the existing conditions for all of the major transportation facilities in the vicinity of the site, including the roadway network, transit service, and bicycle and pedestrian facilities. Also included are the existing levels of service of the key intersections and freeway segments in the study area.

### Existing Roadway Network

Regional access to the project site is provided via SR 87, US 101, I-280, and I-680. These facilities are described below.

*SR 87* is a six-lane freeway that is aligned in a north-south orientation. SR 87 begins at its interchange with SR 85 and extends northward to US 101. Access to the project site is provided by ramps at Capitol Expressway/Narvaez Avenue and Curtner Avenue.

*US 101* is an eight-lane freeway (three mixed-flow lanes and one HOV lane in each direction) in the vicinity of the site. US 101 extends northward through San Francisco and southward through Gilroy. Access to and from the site is provided via full interchanges at Capitol Expressway, Tully Road, and SR 85.

*Interstate-280* connects from US 101 in San Jose to I-80 in San Francisco. It is generally an eight-lane freeway in the vicinity of downtown San Jose. It also has auxiliary lanes between some interchanges. The section of I-280 just north of the Bascom Avenue overcrossing has six mixed-flow lanes and two high-occupancy-vehicle (HOV) lanes. I-280 provides access to the project area via its interchanges with SR 87 and US 101.

*Interstate-680* is a 8-lane freeway that extends north from its transition from I-280 near US 101 through Milpitas. Access to the project area is provided indirectly via its transition to I-280 near US 101.

Local access to the site is provided by Monterey Road (SR 82), Curtner Avenue, Capitol Expressway, Almaden Expressway, Hillsdale Avenue, Narvaez Avenue, and Snell Avenue. These roadways are described below.

*Monterey Road (SR 82)* is a six-lane major arterial that is oriented in a north-south direction. Monterey Road extends southward into Morgan Hill and northward into San Francisco. Access to the site is provided via Capitol Expressway and Curtner Avenue.

*Curtner Avenue* is an east-west arterial street extending from Camden Avenue near SR 17 to Tully Road just east of Monterey Road. Curtner Avenue is generally four lanes, however it widens to six Tully Road is six lanes wide and provides access to US 101. Curtner Avenue provides access to SR 87 and the project site via its intersection with Communications Hill Boulevard

*Capitol Expressway* is a six-lane major arterial that is aligned in an east-west orientation. Capitol Expressway begins at its interchange with I-680 in east San Jose, where it changes designation from San

Antonio Street, and extends to the south and west where it changes designation to Hillsdale Avenue at Almaden Expressway. Access to the site is provided via Vistapark Drive, Narvaez Avenue, and Snell Avenue.

*Almaden Expressway* is predominantly a six-lane expressway that extends from the Almaden Valley in south San Jose to Alma Avenue in the downtown area, where it narrows and transitions into a one-way couplet. Almaden Expressway provides access to the site via Curtner Avenue, Hillsdale Avenue, and Capitol Expressway.

*Hillsdale Avenue* is currently an east-west two-to-four lane arterial. Hillsdale Avenue begins at Pearl Avenue and extends eastward beyond Snell Avenue terminating just west of the railroad tracks. Access to Hillsdale Avenue is provided via Narvaez Avenue and Snell Avenue and direct access to the site is provided by the intersection of Vistapark Drive and Hillsdale Avenue.

*Narvaez Avenue* is a two-lane collector that begins at the Helzer residential development east of SR 87 and extends southward beyond Branham Lane where it terminates at Calpella Drive. Narvaez Avenue provides direct access to the SR-87 northbound ramps and to the project site via Hillsdale Avenue.

*Snell Avenue* is a four-lane collector that begins south of Santa Teresa Boulevard and extends northward to Hillsdale Avenue where it terminates. Access to the site is provided via Capitol Expressway and Hillsdale Avenue.

## Existing Bicycle and Pedestrian Facilities

Bicycle facilities are divided into three classes of relative significance. Class I bikeways are bike paths that are physically separated from motor vehicles and offer two-way bicycle travel on a separate path. Class II bikeways are striped bike lanes on roadways that are marked by signage and pavement markings. Class III bikeways are bike routes and only have signs to help guide bicyclists on recommended routes to certain locations. The locations of existing bicycle facilities are shown on Figure 4.

Currently, class II bike lanes are provided on the following roadway segments:

- Cherry Avenue between Curtner Avenue and Almaden Expressway (2.50 Miles)
- Curtner Avenue/Tully Road between Quimby Road and Leigh Avenue (6.8 Miles)
- Monterey Road between Metcalf Road and Curtner Avenue (8.0 Miles)
- Narvaez Avenue between Hillsdale Avenue and Branham Lane (1.2 Miles)
- Snell Avenue between Hillsdale Avenue and Curie Drive (4.0 Miles)
- Pearl Avenue between Capitol Expressway and Branham Lane (0.70 Mile)
- Branham Lane between Cherry Avenue and Monterey Road (3.60 Miles)
- Senter Road, between Keyes Street and south of Capitol Expressway (2.85 Miles)
- Seventh Street, between San Jose State University and Curtner Avenue (2.5 Miles)

Adjacent to SR 87 is a City of San Jose and Santa Clara County Class I bicycle facility (off-street bike path) that runs between Willow Street and Curtner Avenue, and continues southward to connect to the bicycle lane on Narvaez Avenue. This path accesses the Tamien Caltrain/Light Rail station, located just north of Alma Avenue, and the Curtner Light Rail station to the south. Bike lockers and bike racks are provided at the Curtner, Capitol, and Branham LRT stations. These bike paths are also available for use by pedestrians.

In addition, The City of San Jose bicycle master plan, *San Jose Bike Plan 2020*, provides policies and improvements to bicycle facilities to improve the use of bicycles in the City. It includes an inventory of existing bicycle facilities and identifies locations for enhancement of existing facilities by expansion and/or establishing potential connections.

Pedestrian facilities in the project area consist primarily of sidewalks along the streets in most residential and commercial areas, as well as the aforementioned bike/pedestrian path. Sidewalks are found along virtually all previously described local roadways in the study area, with a few exceptions, and along the

**Figure 4**  
**Existing Bicycle Facilities**

local residential streets and collectors near the site. Within the study area, there are no sidewalks along the following roadways:

- North side of Curtner Avenue between Communications Hill Boulevard and Canoas Garden Avenue
- The north side of Hillsdale Avenue between Old Hillsdale Avenue and Victoria Place
- The west side of Narvaez Avenue along its entire extent.
- The south side of Capitol Expressway between Snell Avenue and Monterey Highway
- The west side of Monterey Highway from just south of Southside Drive

Pedestrian access between Capitol Expressway and Monterey highway is limited to stairs along the North side of Capitol Expressway that provide a connection to the sidewalk along the east side of Monterey highway.

## Existing Transit Service

Existing transit service to the study area is provided by the VTA and Caltrain. The existing transit services are described below and shown on Figure 5.

### *VTA Transit Service*

#### Bus Service

The project site is primarily served by six VTA bus lines. The closest bus stops are located near the intersections of Communications Hill Boulevard/Curtner Avenue and Capitol Expressway/Vistapark Drive.

**Local Route 26** provides service between the Eastridge Transit Center and the Sunnyvale/Lockheed Martin Transit Center. Route 26 operates along Curtner Avenue and Tully Road in the project study area, with 30-minute headways during the weekday peak commute hours and 30-minute headways during most of the day on weekends. Bus stops for Route 26 are located approximately one mile from the project site and are situated on the south side of Curtner Avenue just east of Communications Hill Boulevard, and on the north side of Curtner Avenue just west of Little Orchard Street.

**Local Route 37** provides weekday service between the Capitol LRT Station and West Valley College. Route 37 operates along Narvaez and Hillsdale Avenues in the project study area, with 30-minute headways during the weekday peak commute hours.

**Local Route 66** provides service between Kaiser Hospital and Dixon Landing Road in Milpitas. Route 66 operates along Monterey Road in the project study area, with 15-minute headways during the weekday peak commute hours and 30-minute headways during most of the day on weekends.

**Local Route 68** provides service between the San Jose Diridon Station and Gavilan College in Gilroy. Route 68 operates along Monterey Highway in the project study area, with 15- to 30-minute headways during the weekday peak commute hours and 30-minute headways during most of the day on weekends.

**Local Route 70** provides service between the Capitol LRT Station and the Great Mall Transit Center in Milpitas. Route 70 operates along Capitol Expressway in the project study area, with 30-minute headways during the weekday peak commute hours and 20-minute headways during most of the day on weekends.

**Limited Stop Route 304** provides service between the Santa Teresa LRT station and the Sunnyvale transit center, with stops in downtown San Jose. It operates along Monterey Highway in the project study area. Limited Stop Route 304 operates on 30-minute headways during the weekday peak commute hours and does not operate on weekends.

**Figure 5**  
**Existing Transit Services**

### **Light Rail Transit (LRT) Service**

There are two LRT stations located approximately one mile from the project site. The Curtner LRT station is located at the Curtner Avenue and Canoas Garden Avenue intersection and provides a direct connection to VTA bus service (Local Route 26). The Capitol LRT station is located near the SR 87/Capitol Expressway interchange and provides a direct connection to VTA bus service (Local Routes 37 and 70). Each of the LRT stations offer bicycle lockers, a Park & Ride lot, and long-term airport parking.

LRT service at the Curtner and Capitol LRT stations is provided by the Alum Rock-Santa Teresa LRT line, which operates nearly 24 hours a day (4:00 AM to 1:00 AM) with 10-15-minute headways during peak commute and midday hours. The Alum Rock-Santa Teresa LRT line provides service from the Santa Teresa station in south San Jose, through downtown San Jose to north San Jose where it curves east and operates along the Tasman Corridor, bends south and runs along the Capitol Corridor, and ultimately terminates in east San Jose just south of Alum Rock Avenue.

### **Caltrain**

Caltrain operates a commuter rail service seven days a week between the Diridon Station in San Jose and San Francisco. During weekday commuting hours, Caltrain also serves south San Jose and the south county including Gilroy, San Martin, and Morgan Hill.

The Capitol Caltrain station is the nearest Caltrain station and is located at the intersection of Monterey Road and Fehren Drive. Caltrain provides weekday commute service to the Capitol Caltrain station with three northbound trains during the AM peak commute hour and three southbound trains during the PM peak commute hours. The Capitol Caltrain station offers a 379-space parking lot and a direct connection to VTA bus routes (Local Routes 66 and 68, and Express Route 304). Currently there is no direct access point to the Capitol Caltrain Station from the project site. The 2.25-mile route to the Capitol Caltrain Station from the Communication Hill area includes the use of Snell Avenue and the Capitol Expressway overcrossing of Monterey Highway.

## **Existing Intersection Lane Configurations**

The existing lane configurations at the study intersections were obtained from the City of San Jose TRAFFIX database and confirmed with observations in the field. Lane configurations for each of the study intersections can be found within the level of service calculation sheets in Appendix C.

## **Existing Traffic Volumes**

Existing peak-hour traffic volumes were obtained from the City of San Jose TRAFFIX database and supplemented with manual turning-movement counts (conducted in September 2012 and March 2013) at 79 of the 83 study intersections. Traffic counts from September 2011 were used at two study intersections. A comparison of traffic counts from 2008/2009 and 2011 counts indicate that traffic volumes have not changed significantly. Given that the two intersections at which 2011 counts were used in the analysis are currently operating at LOS C or better conditions, the use of the 2011 traffic counts does not significantly affect the intersection analysis. In addition, the AM peak hour count collected at the Senter Road and Capitol Expressway intersection in September 2012 was found to be inconsistent with historical counts at the intersection. It is likely that ongoing construction at the US 101/Capitol Expressway interchange had an effect on traffic patterns at the time of the count. Therefore, the most recent count, collected in 2009, was used for the AM peak hour analysis at the intersection. Intersection turning-movement counts conducted for this analysis are presented in Appendix A. The existing peak-hour intersection volumes at each study intersection are included in Appendix B.

## Existing Intersection Levels of Service

Intersection levels of service were evaluated against City of San Jose and CMP standards. A table summarizing the intersection level of service results for all intersections and calculation sheets are included in Appendix C. Figure 6 presents worst-case peak hour levels of service under existing conditions for all study intersections.

### City of San Jose Intersection Analysis

The results show that, measured against the City of San Jose level of service policy, the following six signalized study intersections currently operate at an unacceptable LOS E during at least one of the peak hours (see Table 3):

- 18 Almaden Expressway and Blossom Hill Road\*
- 49 Meridian Avenue and Hamilton Avenue
- 55 Capitol Expressway and Quimby Road\*
- 57 Capitol Expressway and Aborn Road\*
- 58 Capitol Expressway and Silver Creek Road\*
- 74 Meridian Avenue and Hillsdale Avenue\*

Five of the six intersections are CMP designated intersections. All other study intersections currently operate at an acceptable LOS D or better during both the AM and PM peak hours of traffic.

### CMP Intersection Analysis

The results of the level of service analysis show that, measured against CMP standards, all of the CMP intersections currently operate at an acceptable LOS E or better during the AM and PM peak hours of traffic.

**Table 3**  
**Existing Unacceptable Intersection Levels of Service**

| Study Number                                                      | Intersection                              | Peak Hour | Count Date | Avg. Delay  | LOS      |
|-------------------------------------------------------------------|-------------------------------------------|-----------|------------|-------------|----------|
| 18                                                                | Almaden Expressway and Blossom Hill Road* | AM        | 09/25/12   | 51.6        | D        |
|                                                                   |                                           | PM        | 09/06/12   | <b>57.5</b> | <b>E</b> |
| 49                                                                | Meridian Avenue and Hamilton Avenue       | AM        | 03/28/13   | 54.2        | D        |
|                                                                   |                                           | PM        | 03/28/13   | <b>56.6</b> | <b>E</b> |

**Figure 6**  
Existing Conditions Intersection Levels of Service

## Existing Freeway Levels of Service

Traffic volumes and levels of service for the subject freeway segments were taken from the 2012 CMP Annual Monitoring Report. Based on the monitoring report, the mixed-flow lanes on 30 of the 56 directional freeway segments analyzed currently operate at an unacceptable LOS F during at least one of the peak hours. In addition, the HOV lanes on eight directional freeway segments studied also are operating at LOS F during at least one of the peak hours. The results of the analysis are summarized in Table 4.

Nearly all peak direction freeway segments studied area are currently operating under extremely congested traffic conditions. The peak directions of travel are northbound during the AM peak hour and southbound during the PM peak hour. Congested conditions are apparent on northbound SR 87 between SR 85 to I-280 during the AM peak hour. Degraded levels of service on the SR 87 freeway segments are primarily attributable to traffic moving through the project area bound for employment destinations to the north. Congested traffic conditions on US 101 and I-280 in both peak directions of travel are due to the inadequate capacity of the freeways.

## Existing Freeway On-Ramp Operations

As a supplement to the intersection level of service analysis, the freeway on-ramps serving the project site were analyzed in order to identify their current operation levels. The project would primarily be served by two freeway on-ramps: (1) northbound SR 87 on-ramp at Narvaez Avenue, and (2) northbound SR 87 on-ramp at Curtner Avenue. Both of these on-ramps were found to be controlled by a meter during the AM peak hour. The existing queue length at each of these ramps and the existing service rate of the meters at the ramps were measured in the field during the AM peak hour. Since the meters at the northbound on-ramps are not operating during the PM peak hour, the PM peak hour was not surveyed. With the information obtained, the maximum observed queue lengths and their corresponding wait times (the time it took a vehicle at the end of the queue to go through the meter) were derived. These are summarized in Table 5 below.

The queue lengths at the study freeway on-ramps were measured for 2 hours in the morning (peak AM period) on two different days. The queues were measured every 5 minutes, and the longest observed queue during the peak hour (reported on Table 5) used as base information in the analysis. In addition, the ramp meters' service rate also was measured. This was done by simply measuring the length of time needed to serve 10 queued vehicles. Based on the surveyed queue length and the meters' service rate, the maximum wait time for a vehicle waiting at the end of the queue was estimated. It should be noted that the wait times shown on Table 5 correspond to the maximum observed queue length, which means this is the longest time any given person waiting at the queue will have to wait to go through the meter.

## Observed Existing Traffic Conditions

Traffic conditions in the field were observed in order to identify existing operational deficiencies and to confirm the accuracy of calculated levels of service. The purpose of this effort was (1) to identify any existing traffic problems that may not be directly related to intersection level of service, and (2) to identify any locations where the level of service calculation does not accurately reflect level of service in the field.

Field observations revealed the following operational problems that may not be reflected in level of service calculations:

*SR 87 and Narvaez Avenue* – During the AM peak hour, the queue of vehicles accessing the SR 87 northbound on-ramp from northbound and southbound Narvaez Avenue are considerably long. The northbound queue on Narvaez Avenue extends beyond the intersection of Narvaez Avenue/Capitol

**Table 4**  
**Existing Freeway Segment Levels of Service**

| Freeway Segment                              | Direction | Peak Hour | Mixed-Flow Lane |               |           |            |   | LOS/a/ | HOV Lane      |               |           |            |        |

| Notes:<br><sup>1</sup> Existing queue length represents the longest queue observed during an hour period.<br>Existing wait times were estimated based on surveyed times at the ramps conducted on August/September 2013.<br><sup>2</sup> The reported northbound and southbound Narvaez queues at SR 87 includes 34 vehicles on the loop ramp (from the meter to the signal). |           |        |                                     |                          |                                     |

Expressway along both the eastbound left-turn approach and the westbound right-turn approach. It was observed that because of the long queues along Narvaez Avenue, eastbound left-turning traffic on Capitol Expressway to northbound Narvaez Avenue would constantly block the intersection hindering the flow of westbound traffic along Capitol Expressway. Plenty of queue storage space for the southbound queue on Narvaez Avenue was observed. These queues will be analyzed in detailed in the subsequent section of the report.

*SR 87 and Curtner Avenue* – During the AM peak hour, the queue of vehicles accessing the northbound SR 87 on-ramp from westbound Curtner Avenue is considerably long. The vehicle queue was observed to extend on the ramp and extends beyond the intersection of SR 87 northbound ramps/Curtner Avenue along both the eastbound left-turn approach and the westbound right-turn approach. It was observed that because of the long queues on the on-ramp, eastbound left-turning traffic on Curtner Avenue to the on-ramp would constantly block the intersection hindering the flow of westbound traffic along Curtner Avenue. This queue will be analyzed in detailed in the subsequent section of the report.

All other study intersections operate without any major operational problems.

### 3.

## Existing Plus Project Conditions

---

This chapter describes existing traffic conditions with the addition of the traffic that would be generated by the proposed project. Existing plus project traffic conditions could potentially exist if all development planned as part of the project was constructed and occupied prior to the other approved projects in the area. This scenario describes a less congested traffic condition, since it ignores any potential traffic from prior approvals. Existing plus project conditions includes all proposed roadway improvements planned as part of the project. However, it is unlikely that this traffic condition would occur, since other approved projects expected to add traffic to the study area would likely be built and occupied prior to the completion of the proposed industrial uses of the project. Projected traffic volumes based on the trip generation estimates and assignment of project trips were developed using the same methods discussed and presented in Chapter 5.

### Transportation Network Under Existing Plus Project Conditions

It is assumed in this analysis that the transportation network under existing plus project conditions would include those project improvements described within Chapter 5 of this report.

### Existing Plus Project Traffic Volumes

Existing plus project peak hour traffic volumes were estimated by adding forecasted traffic growth due to the proposed project to existing traffic volumes. Forecasted traffic volumes were developed with the use of the City's CUBE traffic forecasting model. The forecasted traffic volumes consist of the traffic estimated to be generated by the proposed project development along with adjustments to existing traffic volumes due to changes in traffic patterns. The existing plus project peak-hour intersection volumes at each study intersection are included in Appendix B.

### Existing Plus Project Intersection Analysis

Intersection levels of service under existing plus project conditions without and with the Pullman Way extension were evaluated against City of San Jose and CMP standards. A table summarizing the intersection level of service results for all intersections is included in Appendix C. Figure 7 presents worst-case peak hour levels of service under existing plus project conditions for all study intersections.

#### *City of San Jose Intersection Analysis*

The results show that, measured against the City of San Jose level of service policy, the following nine signalized study intersections are projected to operate at an unacceptable LOS E or worse during at least one of the peak hours under existing plus project conditions (see Table 6):

**Table 6**  
**Existing Plus Project Unacceptable Intersection Levels of Service**

| Study<br>Number                                                   | Intersection                              | Peak<br>Hour | Existing      |          | Existing Plus<br>Project |          |

| * Denotes CMP Intersections<br>- Bold indicates unacceptable LOS. |                                           |              |               |          |                          |          |

- 13 Almaden Expressway and Foxworthy Avenue
- 18 Almaden Expressway and Blossom Hill Road\*
- 22 Communications Hill Boulevard and Curtner Avenue
- 33 Snell Avenue and Capitol Expressway\*
- 49 Meridian Avenue and Hamilton Avenue
- 55 Capitol Expressway and Quimby Road\*
- 57 Capitol Expressway and Aborn Road\*
- 58 Capitol Expressway and Silver Creek Road\*
- 74 Meridian Avenue and Hillsdale Avenue\*

Six of the nine intersections are CMP designated intersections. All other study intersections are projected to operate at an acceptable LOS D or better during both the AM and PM peak hours of traffic.

### **CMP Intersection Analysis**

The results of the level of service analysis show that, measured against CMP standards, all CMP intersections are projected to operate at an acceptable LOS E or better during the AM and PM peak hours of traffic under existing plus project conditions.

**Figure 7**  
Existing Plus Project Conditions Intersection Levels of Service

## 4.

# Background Conditions

---

This chapter presents background traffic conditions, which are defined as conditions just prior to completion of the proposed project. It describes the planned transportation system, the procedure used to determine background traffic volumes, and the resulting traffic conditions. The background scenario predicts a realistic traffic condition that would occur as approved development is built and occupied.

### Background Transportation Network

It is assumed in this analysis that the transportation network under background conditions would be the same as the existing transportation network with the exception of the following intersection improvements planned as part of other development or Capital Improvement Projects:

*King Road and Tully Road* - Addition of a second southbound left-turn lane and third eastbound through lane (Evergreen Development Policy)

*Almaden Road and Alma Avenue* – Conversion of Almaden Road from one-way to two-way operations (CIP)

*Vine Street and Alma Avenue* – Conversion of Vine Street from one-way to two-way operations (CIP)

*2nd Street and Keyes Street* – Conversion of 2nd Street from one-way to two-way operations (CIP)

*3rd Street and Keyes Street* – Conversion of 3rd Street from one-way to two-way operations (CIP)

*Almaden Expressway and SR 85 (North)* – Addition of a dedicated right-turn lane on the off-ramp.

*Almaden Expressway and Cherry Avenue* – Addition of a fourth northbound and southbound through lanes, second southbound left-turn lane, exclusive eastbound left-turn lane, and second westbound left-turn lane (Development)

*McLaughlin Avenue and Capitol Expressway* - Addition of second northbound and southbound left-turn lanes (Evergreen Development Policy)

*Capitol Expressway and Aborn Road* - Addition of second northbound and eastbound left-turn lanes and fourth northbound and southbound through lanes (Evergreen Development Policy)

*Capitol Expressway and Quimby Road and* - Addition of a second eastbound left-turn lane and fourth northbound and southbound through lanes (Evergreen Development Policy)

*Capitol Expressway and Tully Road* - Addition of fourth northbound and southbound through lanes (Evergreen Development Policy)

*Capitol Expressway and Nieman Boulevard* - Addition of fourth northbound and southbound through lanes (Evergreen Development Policy)

## Background Traffic Volumes

Background peak hour traffic volumes were estimated by adding to existing volumes the estimated traffic from approved but not yet constructed developments. The added traffic from approved but not yet constructed developments was obtained from the City of San Jose's Approved Trips Inventory (ATI) database. The background traffic scenario predicts a realistic traffic condition that would occur as approved development is built. The approved trips and traffic volumes for all components of traffic are tabulated in Appendix B.

## Intersection Levels of Service Under Background Conditions

Intersection levels of service under background conditions were evaluated against City of San Jose and CMP standards. A table summarizing the intersection level of service results for all intersections is included in Appendix C. Figure 8 presents worst-case peak hour levels of service under background conditions for all study intersections.

### *City of San Jose Intersection Analysis*

The results show that, measured against the City of San Jose level of service policy, the following seven signalized study intersections are projected to operate at an unacceptable LOS E or worse during at least one of the peak hours under background conditions (see Table 7):

- 18 Almaden Expressway and Blossom Hill Road\*
- 49 Meridian Avenue and Hamilton Avenue
- 55 Capitol Expressway and Quimby Road\*
- 57 Capitol Expressway and Aborn Road\*
- 58 Capitol Expressway and Silver Creek Road\*
- 63 Monterey Road and Chynoweth Avenue
- 74 Meridian Avenue and Hillsdale Avenue\*

Five of the seven intersections are CMP designated intersections. All other study intersections are projected to operate at an acceptable LOS D or better during both the AM and PM peak hours of traffic.

### *CMP Intersection Analysis*

The results of the level of service analysis show that, measured against CMP standards, the intersection of Capitol Expressway and Quimby Road is projected to operate at LOS F conditions during the PM peak hour under background conditions. All other CMP intersections are projected to operate at an acceptable LOS E or better during the AM and PM peak hours of traffic.

## Background Freeway On-Ramp Analysis

With the addition of approved project trips to the study freeway on-ramps (SR 87 on-ramps at Narvaez Avenue and Curtner Avenue), the estimated maximum queue lengths and the wait time at the ramps were projected to increase. The number of vehicles that would be added to the existing queue under background conditions was estimated using a ratio developed by comparing the existing volumes and approved trips. Based on the projected queue length under background conditions, the wait time for a vehicle at the end of the maximum queue length to move through the meter was calculated. However, approved traffic is only projected to be added to the Curtner Avenue on-ramp from westbound Curtner

Avenue. At the Curtner Avenue on-ramp, 65 approved trips are projected to be added to the freeway on-ramp from westbound Curtner Avenue. These additional trips would cause the total wait time for a vehicle at the end of the maximum queue on westbound Curtner Avenue to increase by nearly three minutes. The queue length and wait time at the other ramps studied would remain unchanged under background conditions. The results of the ramp analysis under background conditions are summarized in Table 8.

**Table 8**  
**Background Freeway Ramp Operations**

| Ramp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Peak Hour | Existing |                                     |                          |                                     | Background |                                     |                        |

## 5.

# Background Plus Project Conditions

---

This chapter describes traffic conditions under background project conditions. It includes a description of the method by which project traffic is estimated and any impacts caused by the project. Background plus project conditions were evaluated relative to background conditions in order to determine potential project impacts. This traffic scenario represents a more congested traffic condition than the existing plus project scenario, since it includes traffic generated by approved projects in the area that are built and occupied.

## Transportation Network Under Background Plus Project Conditions

It is assumed in this analysis that the transportation network under project conditions would be the same as described under background conditions with the exception of roadway improvements planned as part of the project described below.

## Project Description

The proposed project is the build-out of up to the remaining approximately 2,300 residential units allowed within the Specific Plan Area, which is anticipated to occur over a 12-15 year timeframe. It also includes construction of up to 64,800 square feet of commercial/retail uses, parks, open space, trails, streets, storm water facilities, and other associated supporting infrastructure. The proposed 2,300 residential units will consist of townhomes/flats, detached alley townhomes, detached row townhomes, podium condominiums, and apartments in the Village Center. Four podium condominium buildings are proposed as part of the project. Uses within the commercial/retail area would include restaurants, shops, entertainment, and small office consistent with the Specific Plan. Approximately 16 acres of parks and 112 acres of open space will be constructed as part of the proposed project.

The proposed project also includes the future development of approximately 55 acres of industrial park uses in the eastern portion of the site near the base of Communications Hill adjacent to Old Hillsdale Avenue. Details for this development have not yet been determined, although it is anticipated that it would have a Floor Area Ratio (FAR) of approximately 0.6. This would allow approximately 1.44 million square feet of industrial park development, consistent with the Specific Plan and the City's Zoning Ordinance.

Roadways constructed as part of previous development on Communications Hill (primarily the Tuscany Hills project) were sized to accommodate the proposed project. However, the existing roadways would be extended onto the site. As part of the project, the extension of Communications Hill Boulevard including a bridge over the Caltrain/UPRR tracks will be completed. The Communications Hill bridge will accommodate all modes of travel including vehicles, pedestrians, and bicycles. The extension of Communications Hill Boulevard and new bridge will provide a continuous roadway connection between Hillsdale Avenue and Curtner Avenue, and ultimately, to the SR 87 Curtner Avenue ramps.

## Project Trip Estimates

The project as proposed consists of the construction of up to 2,300 residential units, 64,800 s.f. of retail space, up to 1.4 m.s.f. of industrial space, and other supporting services such as a school and parks. The proposed retail and supporting services would primarily serve the existing and the proposed residential units of Communications Hill as well as visitors on the hill. Trip generation estimates for the proposed project were estimated utilizing City of San Jose traffic-forecasting model. The model generated trip estimates were compared with estimates based on standard City of San Jose trip generation rates to ensure that the trip estimates used for the analysis were comparable to those typically used for land uses similar to the proposed project.

### **CUBE Model Trip Generation Estimates**

The City of San Jose's CUBE software-based traffic forecasting model procedures produce projections of AM and PM peak hour traffic generation based on projected land uses. The forecasted trip generation estimates are based on the trip making characteristics of the proposed project land uses. The trip-making characteristics reflected by the model account for mode of travel and interaction of trips between land uses. The forecasts indicate that the project as proposed will generate a net total of 2,636 trips occurring during the AM peak hour and 3,221 trips during the PM peak hour based on the projected trips that start and/or end in the Traffic Analysis Zones (TAZs) that correspond to the project area.

### **Standard Trip Generation Rates**

The standard trip rates, as recommended for use in the City of San Jose are detailed in *the City of San Jose Traffic Impact Analysis Handbook Vol. 1, 2009*. The magnitude of traffic added to the roadway system by a particular development is estimated by multiplying the applicable trip generation rates by the size of the development. The trip estimates for each of the proposed land use components of the proposed project were reduced to account for internalization, or trips made, between each of the proposed land uses. The reductions are based on the assumption that vehicle trips to each of the proposed land uses of the site would be reduced due to internal circulation (i.e. residents patronizing the proposed retail space, or trips made to school and/or work). A reduction of 15% was applied for the internalization, or trips made between residential and retail uses, as recommended by the VTA's *Transportation Impact Analysis Guidelines*, January 2009.

Similarly, the trip generation for the retail portion of the project also was estimated. The retail space, intended to be neighborhood-serving retail not major retail establishments, is planned to be centrally located within the project area and proposed residential units. As such, it is assumed that the majority of trips generated by the retail space would originate from residential units within the project boundaries. Since it is anticipated that the proposed retail space would mainly serve the residential uses within the project area, the trip estimates for the residential land uses of the project were reduced to account for internalization, or interaction, between the retail and residential land uses. It was assumed that 90 percent of the retail trips would originate from the surrounding residential units located on Communications Hill, including both existing and proposed units. Only 10 percent of the trips estimated to be generated by the retail use were assumed to come from outside Communications Hill.

The trip generation estimates do not include estimates for the proposed school and parks. Trip estimates for residential uses account for trips made to schools and other types of land uses. It is assumed that trips to the supporting land uses would originate from within the project area and the proposed residential units.

Based on trip generation rates recommended by the City of San Jose and the above assumptions regarding trip reductions and internalization, the project as proposed is estimated to generate a net total of 31,409 daily trips, with 3,969 trips occurring during the AM peak hour and 3,620 trips during the PM peak hour. The project trip generation estimates based on the City of San Jose Standard trip generations rates are presented in Table 9.

**Table 9**  
**Trip Generation Estimates Based on Standard City of San Jose Trip Rates**

| Land Use                                                                                                                                                                                                                                                | Size                                                | Daily<br>Trip Rates <sup>1</sup> | Daily<br>Trips | AM Peak Hour               |                 |                  |       |       |       | PM Peak Hour               |                 |                  |       |       |       |

| <sup>4</sup> Reduction of 15% applied for mixed-use development with housing and retail components, as prescribed by VTA Guidelines.                                                                                                                    |                                                     |                                  |                |                            |                 |                  |       |       |       |                            |                 |                  |       |       |       |

### ***Adjusted Trip Generation Estimates***

A comparison of trip generation estimates produced using standard trip rates and the model forecasts indicates that the traffic model estimates that the proposed project will generate approximately 35% and 10% less AM and PM peak hour trips, respectively when compared to estimates produced using the standard trip rates. The projected lower trips are likely due to the traffic model assuming a larger percentage of non-auto trips (transit, walk, and bicycle usage).

In order to evaluate a conservative estimate of trips to be generated by the project, the trip generation estimates projected by the model forecasts were adjusted to nearly match, within 0.5%, those estimated using the City's standard trip rates. Based on the adjustments, it is estimated that the proposed project will generate a net total of 3,983 trips occurring during the AM peak hour and 3,628 trips during the PM peak hour. Table 10 presents the comparison of trip generation estimates using both the standard trip rates and the model forecasts. Model forecast also indicate that approximately 12% of the projected peak hour trips that generated by the project would remain within the project boundaries. The internalized trips are composed of trips to and from the proposed homes, school, work, and retail land uses of the propose project.

The analysis represented within this report is based upon the estimated AM and PM peak hour trips. It is during these time periods that the most congested traffic conditions occur on a typical weekday. The City's level of service policy also is based upon the weekday AM and PM peak-hours.

### ***Trip Distribution and Assignment***

The assignment of project generated traffic to the roadway network and each of the study intersections was completed by the CUBE model. The trips estimated to be generated by the project were assigned using a route selection procedure based on minimum travel time paths (as opposed to minimum travel distance paths) between development zones. The model assigns traffic based on roadways and intersections constraints due to congestion and capacity. This capacity-constrained traffic assignment process enables the model to reflect diversion of traffic, including existing traffic already on the roadway network, around congested areas of the overall street system.

Figure 9 shows the resulting distribution, based on the model assignment, of project traffic on the primary roadways in the project area. It should be noted that the percentages presented in Figure 10 do not total 100% because some smaller percentages of project traffic will utilize local streets. A tabular summary of the projected traffic growth due to the proposed project at each study intersections is contained in Appendix B.

## **Background Plus Project Traffic Volumes**

Background plus project peak hour traffic volumes were estimated by adding forecasted traffic growth due to the proposed project to background traffic volumes. Forecasted traffic volumes were developed with the use of the City's CUBE traffic forecasting model. The forecasted traffic volumes consist of the traffic estimated to be generated by the proposed project development along with adjustments to existing traffic volumes due to changes in traffic patterns. The background plus project peak-hour intersection volumes at each study intersection are included in Appendix B.

## **Background Plus Project Conditions Intersection Analysis**

Intersection levels of service under background plus project conditions were evaluated against City of San Jose and CMP standards. A table summarizing the intersection level of service results for all intersections is included in Appendix C. Figure 10 presents worst-case peak hour levels of service under background plus project conditions for all study intersections.

**Table 10**

**Background Plus Project Conditions Intersection Levels of Service**

### ***City of San Jose Intersection Analysis***

The results show that, measured against the City of San Jose level of service policy, the following 11 signalized study intersections are projected to operate at an unacceptable LOS E or worse during at least one of the peak hours under background plus project conditions (see Table 11):

- 3 Monterey Road and Curtner Avenue\*
- 13 Almaden Expressway and Foxworthy Avenue
- 18 Almaden Expressway and Blossom Hill Road\*
- 22 Communications Hill Boulevard and Curtner Avenue
- 33 Snell Avenue and Capitol Expressway\*
- 49 Meridian Avenue and Hamilton Avenue
- 55 Capitol Expressway and Quimby Road\*
- 57 Capitol Expressway and Aborn Road\*
- 58 Capitol Expressway and Silver Creek Road\*
- 63 Monterey Road and Chynoweth Avenue
- 74 Meridian Avenue and Hillsdale Avenue\*

Seven of the eleven intersections are CMP designated intersections. All other study intersections are projected to operate at an acceptable LOS D or better during both the AM and PM peak hours of traffic.

### ***CMP Intersection Analysis***

The results of the level of service analysis show that, measured against CMP standards, the intersection of Capitol Expressway and Quimby Road is projected to operate at an unacceptable LOS F conditions during at least one peak hour under background plus project conditions. All other CMP intersections are projected to operate at an acceptable LOS E or better during the AM and PM peak hours of traffic.

## **Project Impacts and Mitigation Measures**

This section discusses the project impacts identified under background project conditions. Included are descriptions of project impacts to intersections and freeway segments and proposed mitigation measures.

### ***Intersection Impacts and Mitigation Measures***

Based on the City of San Jose significance criteria, four of the 11 intersections identified to operate at unacceptable levels of service would be significantly impacted by the project.

- 3 Monterey Road and Curtner Avenue\*
- 13 Almaden Expressway and Foxworthy Avenue
- 22 Communications Hill Boulevard and Curtner Avenue
- 33 Snell Avenue and Capitol Expressway\*

Two of the four intersections identified to be significantly impacted by the project based on City of San Jose criteria are CMP designated intersections. The two CMP intersections are projected to meet the CMP LOS standard of LOS E. The addition of project traffic at the remaining intersections identified to operate at an unacceptable LOS E or worse will not be sufficient to meet significance criteria.

Potential physical improvements were identified at each of the impacted intersections. However, each of the identified improvements will require the acquisition of right-of-way that is not currently available. Thus, in lieu of the identified physical mitigations, which are infeasible, this project relies on the adoption of an Area Development Policy (ADP) to establish special traffic level of service standards for a specific geographic area; the Communications Hill Specific Plan area. Impacts at these intersections would be significant and unavoidable due to the lack of feasible mitigation to reduce these impacts to a less than significant level.

**Table 11**  
**Background Plus Project Conditions Unacceptable Intersection Levels of Service**

| Study Number                                                                                                                                   | Intersection                              | Peak Hour | Background         |          | Background Plus Project |          |                      |                    |

The ADP would provide new and enhanced non-auto travel mode facilities such as trails, bikeways, connections to transit, and improvements on major roadways and freeway entrances. While these improvements would not reduce the identified intersection impacts to a less than significant level, they are consistent with General Plan goals and policies that seek to maximize the efficiency, safety, and connectivity of the existing street system while promoting complete streets that provide for pedestrian, bicycle, and public transit modes of travel. The planned improvements included in the Communications Hill Specific Plan ADP are described in the following section.

For informational purposes, each of the identified potential physical intersection improvements that were identified at each impacted intersection are described below along with a description as to why it is preferred that each improvement not be implemented. The improvements to other roadway facilities in the immediate project area and non-auto travel mode facilities will be incorporated into an Area Development Policy (ADP) for the project.

### **(3) Monterey Road and Curtner Avenue\***

**Impact:** The level of service would be an acceptable LOS D under background conditions and the addition of project traffic would cause the intersection to degrade to an unacceptable LOS E during the PM peak hour under background plus project conditions. This constitutes a significant impact by City of San Jose standards.

**Potential Mitigation Measure.** The necessary improvement to mitigate the project impact at this intersection would consist of the addition of an exclusive southbound right-turn lane. The intersection improvement would require the acquisition of approximately four feet of right-of-way for approximately 225 feet along the west side of Monterey Road just north of Curtner Avenue. In addition, the improvements will require the removal and relocation of utility poles and the bus duct-out along Monterey Road and relocation of trash enclosures and parking within the adjacent shopping center. The extent of right-way-acquisition and other infrastructure improvements make the implementation of the improvement impractical. The impact to the intersection can be reduced by implementing improvements to other roadways in the immediate project area and non-auto travel mode facilities as identified in the Communications Hill Specific Plan ADP.

### **(13) Almaden Expressway and Foxworthy Avenue**

**Impact:** The level of service would be an acceptable LOS D under background conditions and the addition of project traffic would cause the intersection to degrade to an unacceptable LOS E during the PM peak hour under background plus project conditions. This constitutes a significant impact by City of San Jose standards.

**Potential Mitigation Measure.** The necessary improvement to mitigate the project impact at this intersection would consist of the addition of a second westbound left-turn lane. The intersection improvement would require the acquisition of approximately 10 feet of right-of-way for approximately 100 feet along the north side of Foxworthy Avenue just east of Almaden Expressway. In addition, the improvements will require the removal of the island at the northeast corner of the intersection, removal of trees and removal of parking within the adjacent shopping center along the north side of Foxworthy Avenue. The extent of right-way-acquisition make the implementation of the improvement impractical. The impact to the intersection can be reduced by implementing improvements to other roadways in the immediate project area and non-auto travel mode facilities as identified in the Communications Hill Specific Plan ADP.

### **(22) Communications Hill Boulevard and Curtner Avenue**

**Impact:** The level of service would be an acceptable LOS C under background conditions and the addition of project traffic would cause the intersection to degrade to an unacceptable LOS E during the PM peak hour under background plus project conditions. This constitutes a significant impact by City of San Jose standards.

Potential Mitigation Measure. The necessary improvement to mitigate the project impact at this intersection would consist of the addition of a second westbound left-turn lane. The intersection improvement would improve intersection operating levels to LOS D during the PM peak hour.

### **(33) Snell Avenue and Capitol Expressway\***

**Impact:** The level of service would be an acceptable LOS D under background conditions and the addition of project traffic would cause the intersection to degrade to an unacceptable LOS E during the PM peak hour under background plus project conditions. This constitutes a significant impact by City of San Jose standards.

Potential Mitigation Measure. The necessary improvement to mitigate the project impact at this intersection would consist of the addition of a third southbound left-turn lane. The intersection improvement would require the acquisition of approximately 10 feet of right-of-way for approximately 350 feet along the west side of Snell Avenue just north of Capitol Expressway. In addition, the improvements will require the removal of the corner islands along the west side of the intersection, and removal and relocation of utility poles along the west side of Snell Avenue. The extent of right-way-acquisition makes the implementation of the improvement impractical. The impact to the intersection can be reduced by implementing improvements to other roadways in the immediate project area and non-auto travel mode facilities as identified in the Communications Hill Specific Plan ADP.

### ***Communications Hill Area Development Policy***

The Communications Hill Specific Plan Area Development Policy (CHSPADP) will provide for the implementation of several improvements to the roadway system, transit system, and pedestrian and bicyclist facilities in the immediate area of the proposed project. The purpose of the ADP is to establish a variance from the City's standard Level of Service Policy to allow for a balanced transportation system as identified by goals and policies of the City of San Jose Envision 2040 General Plan. The Envision 2040 General Plan allows for exceptions to the City's standard Level of Service Policy with the establishment of an ADP with the intent to meet City of San Jose Transportation Policies. In particular, the CHSPADP provides for improvement to the transportation system to meet the City of San Jose Transportation Policies that provide for the following:

- Encourage the use of non-automobile travel modes to reduce vehicle miles traveled (VMT)
- Consider the impact on the overall transportation system when evaluating the impacts of new developments.
- Increase substantially the proportion of travel modes other than single-occupant vehicles.

Rather than constructing improvements that enhance vehicular capacity at isolated intersections located outside of the immediate project area that are of little benefit to the overall roadway system, the CHSPADP will provide the mechanism for the implementation and funding of improvements to the transportation system in the immediate area of the project site. The CHSPADP includes improvements to primary access points to the freeway system and major roadways, new connections to existing transit services, and the enhancement of pedestrian and bicycle facilities to serve the proposed project as well as the existing neighborhoods in the project area and reduce further demand on other local roadways.

Although the project is not proposing to mitigate the regional freeway impacts or the selected signalized intersections described above, the project is implementing an extensive list of improvements that reduce the significant traffic impacts and provide transportation options for the project. These improvements are intended to make the most of the unique transit opportunities afforded the site.

Right-of-way, encroachment permits, and/or easements from public agencies/jurisdictions may be required for some of the improvements described below. Private property would only need to be acquired to allow access to the pedestrian/bicycle overcrossing of the Caltrain tracks.

As other properties within the CHSP come forward for development, it is expected that they may result in additional impacts at the identified intersections. Subsequent traffic analyses would be required to

determine participation in the ADP. Each of the ADP improvements and benefits of their implementation is discussed below and presented in Figure 11.

### **Curtner Avenue Corridor Improvements**

Curtner Avenue serves as a major east-west arterial that provides access to SR 87 and Almaden Expressway which are primary links to employment lands north of the project area. The Curtner Avenue interchange with SR 87 serves as a major access point from the project area to north and south San Jose.

The addition of project traffic at the intersection of Curtner Avenue and Communications Hill Boulevard would result in a significant impact. Mitigation measures will be implemented to reduce impacts to a less than significant level at the Curtner Avenue and Communications Hill Boulevard intersection as part of this ADP. Other improvements are included as part of the ADP to reduce other impacts of the project, as described below.

In addition, project traffic will contribute to deficient operations at the Curtner Avenue and SR 87 northbound on-ramp. Thus, improvements along the Curtner Avenue corridor that will provide additional capacity to serve project traffic, as well as alleviate congestion along other roadways and intersections in the project area, were identified by the City and will be included as part of the ADP.

In particular, the planned improvements to the SR 87 ramps are expected to reduce congestion and operational issues currently experienced at both the Narvaez Avenue/Capitol Expressway and Curtner Avenue on-ramps. The Envision 2040 General Plan identifies the need to widen Curtner Avenue between Communications Hill Boulevard and SR 87 from its existing four to six lanes. The CHSPADP will provide for the widening of Curtner Avenue in the westbound direction along with specific intersection improvements as described below.

#### **ADP Improvement 1: Widen Curtner Avenue to Five Lanes Between Communications Hill Boulevard and the Almaden Expressway Southbound Off-Ramp**

- Remove existing four-foot wide median and replace with two-foot wide median across existing Curtner Avenue Bridge over the railroad tracks.
- Re-stripe westbound Curtner Avenue lanes from Communications Hill Boulevard to SR 87 on-ramp to accommodate additional through lane.
- Convert westbound lane from Communications Hill Boulevard into dedicated right-turn lane at SR 87 northbound on-ramp.
- Existing Curtner Avenue Bridge over the railroad tracks to remain in place and proposed improvements shall occur within the existing right-of-way.
- Re-stripe Curtner Avenue under SR 87 overpass to improve alignment.
- Modify existing median.
- Maintain existing Class II bicycle lane along Curtner Avenue by restriping it between Communications Hill Boulevard and the Curtner Avenue Bridge over the railroad tracks.

#### **ADP Improvement 2: Intersection of Communications Hill Boulevard and Curtner Avenue**

- Add second westbound left-turn lane from Curtner Avenue onto southbound Communications Hill Boulevard upon modification of existing median.
- Restripe existing westbound right-turn lane onto northbound Communications Hill Boulevard to accommodate an additional through lane upon removal of existing pork chop islands.
- Remove pork chop islands, reduce radius returns on both north and south sides of Curtner Avenue, modify traffic signal including new poles, mast arms, pedestrian facilities, and restriping.

#### **ADP Improvement 3: Intersection of SR 87 Northbound Off-Ramp and Curtner Avenue**

- Modify traffic signal including new mast arm poles, upgrades to pedestrian facilities, and restriping.
- Right-of-way on the south side to be acquired by the City from Caltrans.

**Figure 11**  
CHSPADP Roadway and Bike/Pedestrian Improvements

**ADP Improvement 4: SR 87 Northbound On-Ramp at Curtner Avenue**

- Add second eastbound left-turn lane from Curtner Avenue onto the SR 87 northbound on-ramp.
- Modify the existing median island at the SR 87 and Curtner Avenue intersection.
- Extend the existing HOV lane on the on-ramp back to Curtner Avenue and provide additional mixed-flow lane on the ramp from Curtner to metering light for a total of three lanes on the ramp. This may require additional right-of-way on the east side of SR 87 between Unified Way and the metered on-ramp for approximately 200' feet.
- Add Class I bicycle facility to shoulder along Unified Way. Construct 10-foot paved trail with two-foot shoulders from existing path terminus at bus yard driveway to the corner of Unified Way and Curtner Avenue.
- Install traffic signal at Unified Way at Bus Yard
- CALTRANS to relinquish Unified Way and right-of-way along Curtner Avenue to City of San Jose.
- These improvements require an encroachment permit from CALTRANS

**Capitol Expressway/Narvaez Avenue/SR 87 On/Off Ramps**

The SR 87 freeway ramps at Capitol Expressway and Narvaez Avenue serve as the primary freeway access point and link between the residential land uses in the project area with employment centers north of the project area. The SR 87 on-ramp at Narvaez Avenue currently experiences lengthy queues during the AM peak hour when ramp metering is active.

Although it is projected that the primary freeway access point for the proposed project will be provided by the Curtner Avenue interchange with SR 87 and that the project traffic will have a minimal effect on the SR 87 ramps at Narvaez Avenue, the developer has voluntarily included improvements to this interchange as part of its application for development to the City to alleviate other traffic issues in the vicinity of the project because not all project impacts could be mitigated. These improvements are included in this policy. Improvements have been identified to increase vehicular queue storage at the Narvaez on-ramp in an effort to alleviate operational issues near the freeway ramps. The planned improvements in the vicinity of the Capitol Expressway/Narvaez Avenue/SR 87 On/Off Ramps are discussed below.

**ADP Improvement 5: Improvement to the SR 87 On-Ramp/Narvaez Avenue Corridor**

- Widen Narvaez Avenue from Capitol Expressway northerly to the SR 87/Narvaez on/off ramps to extend two existing northbound through lanes on Narvaez Avenue to the SR 87 northbound on/off ramps.
- Reconfigure the intersection at the SR 87 northbound on/off ramps to improve the intersection operations, queuing for both northbound and southbound Narvaez Avenue, and construction of a retaining wall adjacent to the existing VTA parking lot.
- Modify full traffic signal including improved pedestrian and bike facilities at the SR 87 on/off ramps.
- Modify traffic signal at the intersection of Capitol Expressway and Narvaez Avenue.
- These improvements require an encroachment permit from the County and Caltrans.
- These improvements may require additional right-of-way between the SR 87 ramps and Capitol Expressway at the VTA parking lot (approximately ½ acre).

**Public Transit/Pedestrian/Bike Improvements**

Although the project area is served by several major public transit lines (Caltrain and VTA bus lines and LRT), the project site itself is not served directly by any transit services. In addition, there are no existing pedestrian/bicycle links between the project site and other existing pedestrian/bicycle and transit facilities in the area. The CHSPADP includes several improvements to existing, as well as the construction of new, non-auto facilities with the intent to promote and encourage the use of multi-modal travel options. The identified improvements are consistent with the Envision 2040 General Plan goals and policies that are dedicated to the enhancement of the transportation infrastructure, including public transit and

pedestrian/bike facilities. The Transportation Policies contained in the General Plan create incentives for non-auto modes of travel while reducing the use of single-occupant automobile travel as generally described below:

- Through the entitlement process for new development, fund needed transportation improvements for all transportation modes, giving first consideration to improvement of bicycling walking, and transit facilities.
- Give priority to the funding of multimodal projects to provide the most benefit to all users of the transportation system.

Thus, the implementation of the improvements discussed below are intended to reduce the identified project impacts to the roadway system by providing the project site with viable connections to surrounding pedestrian/bike and transit facilities and provide for a balanced transportation system as outlined in the Envision 2040 General Plan goals and policies..

**ADP Improvement 6: Bicycle and Pedestrian Facility Improvements (Unified Way to Masonic Drive)**

- Construct a Class I bicycle facility (10 feet paved with two-foot shoulders) from trail terminus at Unified Way southerly crossing at SR 87/Curtner Avenue northbound off/on ramp intersection and continuing along the east side of SR 87 ending at Millpond Drive/Masonic Drive.
- Construct a Class I bicycle/pedestrian facility (10 feet paved with two-foot shoulders) from Millpond Drive south along the east side of SR 87 to Carol Drive. This will require the construction of a retaining wall along the east side of the trail.

**ADP Improvement 7: Bicycle and Pedestrian Facility Improvements (Azores Street to Capitol Expressway)**

- Stripe Class II bike lanes along Narvaez Avenue from existing trail terminus at Azores Street/Helzer Road southerly within the existing right-of-way on Narvaez Avenue. Continue the Class II bicycle lane along the newly constructed/widened Narvaez Avenue from the SR 87 off/on ramps to Capitol Expressway.
- The traffic signal at Narvaez Avenue and the SR 87 on/off ramps will be modified to include improved bike/pedestrian crossing.
- This will require right-of-way from the existing VTA parking lot on the west side of Narvaez Avenue.

**ADP Improvement 8: CALTRAIN Pedestrian/Bicycle Connection along Monterey Highway**

Access from the Communications Hill 2 project site to the Capitol Caltrain Station on the east side of the railroad tracks adjacent to Monterey Road can be acquired by way of three options. These options were developed because property would need to be obtained from private property owners. Option #1 assumes the crossing would located north of the existing Capitol Caltrain Station. The overcrossing location for Options #2 and #3 would be approximately the same; adjacent to or very near the existing Station. The design of the crossing itself would be the same regardless of the access location. These options are generally described below and shown on Figure 11.

**Option #1 Alignment**

- Construct approximately 400 linear feet of sidewalk or pathway from the project site to the western landing of the future overcrossing to be located north of the existing Capitol Caltrain Station.
- Construct a pedestrian/bicycle overcrossing between the end of the sidewalk/pathway and the existing sidewalk on the east side of the railroad tracks. The sidewalk on the east side of the railroad tracks along Monterey Road would be utilized to access the Station.
- Requires right-of-way (easement) from at least one private property owner.
- Requires coordination/permit from the Joint Powers Board

**Option #2 Alignment**

- Construct approximately 1,200 linear feet of pathway or trail from the project site to the western landing of the overcrossing to the Caltrain Station. A portion of this trail would run along the east side of the railroad tracks.
- Construct a pedestrian/bicycle overcrossing between the end of the pathway/trail and the Station.
- Requires easement from at least two private property owners.
- Requires coordination/permit from the Joint Powers Board.

**Option #3 Alignment**

- Utilize existing public streets and sidewalks south of the project site to the extent possible to access the future overcrossing. This would require the construction of approximately 2,200 linear feet of new sidewalks from the project site along Hillcap and Hillsdale Avenues and Granite Rock Way. At the terminus of Granite Rock Way, an approximately 400-foot long pathway/trail would be constructed to the western landing of the overcrossing. Construct a pedestrian/bicycle overcrossing between the end of the pathway/trail and the Station.

## **Freeway Segment Level of Service Analysis**

Background plus project conditions traffic volumes for the subject freeway segments were estimated with the use of the traffic model. Background plus project peak hour traffic volumes were estimated by adding forecasted traffic growth due to the proposed project to the Year 2012 CMP traffic volume data. The results show that mixed-flow lanes on 31 of the 56 directional freeway segments analyzed will operate at an unacceptable LOS F during at least one peak hour. In addition, the HOV lanes on eight of the segments also are projected to operate at LOS F conditions. Based on the CMP freeway segment criteria, the project will have a significant impact on mixed-flow lanes on 10 directional freeway segments and HOV lanes on two directional freeway segments during at least one peak hour. The results of the freeway segment analysis under background plus project conditions extension are summarized in Table 12.

The Valley Transportation Authority *VTP 2035* identifies improvements to regional facilities, including freeways, for which a regional funding plan could be used to fund. The Silicon Valley Express Lanes Program, is identified in the *VTP 2035* and will convert existing carpool lanes and add new lanes to provide congestion relief throughout Santa Clara County. The Silicon Valley Express Lanes Program and *VTP 2035* identify improvement of the following impacted freeway segments:

- SR 87 Express Lanes, between SR 85 and US 101
- I-280 Express Lanes, between US 101 and Leland Avenue
- I-680 Express Lanes, between Calaveras Boulevard and US 101

The project along with other projects within Santa Clara County could contribute towards the funding of the improvements. However, full mitigation of significant project impacts on freeway segments is not feasible for an individual development project to bear responsibility for implementing such extensive transportation system improvements. Therefore, significant impacts on the directional freeway segments identified above must be considered significant and unavoidable.

As discussed above, the CHSPADP includes several improvements to existing as well as the construction of new non-auto facilities with the intent to promote and encourage the use of multi-modal travel options to reduce the use of single-occupant automobile travel. The implementation of the improvements are intended to reduce the identified project impacts to the roadway system, including freeways, by providing the project site with viable connections to surrounding pedestrian/bike and transit facilities.

**Table 12**  
**Background Plus Project Freeway Segment Level of Service**

| Freeway |                                       | Segment | Direction | Peak Hour | Existing Plus Project |            |                |           |         |          |               |            |                |           | Project Trips   |     |          |               |        |

## 6.

# Other Transportation Issues

---

This chapter presents an analysis of other transportation issues associated with the project site, including:

- Intersection operations analysis – vehicle queuing and left-turn pocket storage at intersections
- Freeway ramp analysis
- Potential impacts to bike, pedestrian and transit facilities

Unlike the level of service impact methodology, which is adopted by the City Council, the analyses in this chapter are based on professional judgment in accordance with the standards and methods employed by the traffic engineering community.

### Intersection Operations Analysis

The analysis of project intersection level of service was supplemented with an analysis of intersection *operations* for selected signalized intersections. The operations analysis is based on vehicle queuing for high-demand movements at intersections. Vehicle queues were estimated using a Poisson probability distribution, which estimates the probability of “n” vehicles for a vehicle movement using the following formula:

$$P(x=n) = \frac{\lambda^n e^{-\lambda}}{n!}$$

Where:

P (x=n) = probability of “n” vehicles in queue per lane

n = number of vehicles in the queue per lane

$\lambda$  = Average number of vehicles in the queue per lane (vehicles per hour per lane/signal cycles per hour)

The basis of the analysis is as follows: (1) the Poisson probability distribution is used to estimate the 95<sup>th</sup> percentile maximum number of queued vehicles per cycle for a particular movement; (2) the estimated maximum number of vehicles in the queue is translated into a queue length, assuming 25 feet per vehicle; and (3) the estimated maximum queue length is compared to the existing or planned available storage capacity for the movement. This analysis thus provides a basis for estimating future left-turn storage requirements at intersections. The 95<sup>th</sup> percentile queue length value indicates that during the peak hour, a queue of this length or less would occur on 95 percent of the signal cycles. Likewise, a queue length larger than the 95<sup>th</sup> percentile queue would only occur on 5 percent of the signal cycles (about 3 cycles during the peak hour for a signal with a 60-second cycle length). Therefore, left-turn storage pocket designs based on the 95<sup>th</sup> percentile queue length would ensure that storage space would be exceeded only 5 percent of the time. The 95<sup>th</sup> percentile queue length is also known as the “design queue length”. The vehicle queue estimates and a tabulated summary of the findings are provided in Table 13. The vehicular queuing analysis (Poisson probability calculations) is included in Appendix D.

| <sup>1</sup> Vehicle queue calculations based on cycle length for signalized intersections.<br><sup>2</sup> Assumes 25 Feet Per Vehicle Queued |                      |                      |                      |                      |                   |                   |                   |                   |                        |                        |                        |                        |

The following intersections would have inadequate queue storage capacity under project conditions.

### **(13) Almaden Expressway and Foxworthy Avenue**

The existing queue storage capacity of 350 ft. per lane for the southbound left-turn lane on Almaden Expressway to eastbound Foxworthy Avenue is shown to be inadequate to serve the maximum vehicle queues under existing and background plus project conditions.

*Recommendation:* The recommended improvement for the intersection of Almaden Expressway and Foxworthy Avenue is to extend the left-turn lanes on the southbound approach to provide an additional 350 feet of total storage capacity to accommodate the projected queues. The improvement will require removal and reconstruction of the median island along the southbound leg of the intersection and restriping of the lanes.

### **(22) Communications Hill Boulevard and Curtner Avenue**

The existing queue storage capacity of 325 ft. per lane for the northbound, Communications Hill Boulevard, and westbound, Curtner Avenue, left-turn lanes are shown to be adequate to serve the maximum vehicle queues under both existing and background conditions. Under background plus project conditions, the project traffic would extend the queue lengths to approximately 575 ft. (or 19 additional vehicles) at each location. Therefore, the existing queue storage capacity for these movements is projected to be inadequate under project conditions.

*Recommendation:* The improvements for the intersection of Communications Hill Boulevard and Curtner Avenue included in the ADP will provide a second left-turn lane on the westbound approach to provide a total queue storage capacity of 650 ft. The improvement includes the removal of the “pork chop” islands at the southern side of the intersection, relocation of the existing traffic signal, and restriping of the lanes. There are no further feasible improvements to implement on the northbound approach to the intersection. Implementation of the ADP will improve operational deficiencies at this intersection.

### **(32) Vistapark Drive and Capitol Expressway**

The existing queue storage capacity of 325 ft. per lane for the southbound left-turn lane on Vistapark Drive to westbound Capitol Expressway is shown to be adequate to serve the maximum vehicle queue under both existing and background conditions. Under project conditions, the project traffic would extend the queue length to approximately 350 ft. (or one additional vehicle). Therefore, the existing queue storage capacity for this movement is projected to be inadequate under project conditions.

In addition, the existing queue storage capacity of 175 ft. for the eastbound left-turn lane on Capitol Expressway to northbound Vistapark Drive is shown to be adequate to serve the maximum vehicle queue under both existing and background conditions. Under project conditions, the project traffic would extend the queue length to approximately 200 ft. (or one additional vehicle). Therefore, the existing queue storage capacity for this movement is projected to be inadequate under project conditions.

*Recommendation:* The recommended improvements for the intersection of Vistapark Drive and Capitol Expressway is to extend the left-turn lanes on the southbound and eastbound approaches by 25 feet to accommodate the projected queues. These improvements will require removal and reconstruction of median islands along the north and west legs of the intersection and restriping of the lanes. The City has the discretion to include this improvement in the ADP.

### **(33) Snell Avenue and Capitol Expressway**

The existing queue storage capacity of 325 ft. for the southbound left-turn lane on Snell Avenue to westbound Capitol Expressway is shown to be inadequate to serve the maximum vehicle queue under both existing and background conditions. Under background plus project conditions, the project traffic

would extend the queue length to approximately 675 ft. (or 15 additional vehicles). Therefore, the existing queue storage capacity for this movement is projected to be inadequate under project conditions.

**Recommendation:** The recommended improvements for the intersection of Snell Avenue and Capitol Expressway is to provide a third left-turn lane on the southbound approach to provide a total queue storage capacity of 975 ft. The improvement will require right-of-way from adjacent properties, removal of the “pork chop” islands at the northern and southern sides of the intersection, relocation of the existing traffic signal, and restriping of the lanes. These improvements are not currently feasible due to a lack of right-of-way.

## Unsignalized Intersection Analysis (Traffic Signal Warrants)

Although the City of San Jose does not have a level of service standard for unsignalized intersections, the unsignalized study intersection of Old Hillsdale Avenue and Hillsdale Avenue was analyzed for operational purposes. The Old Hillsdale Avenue and Hillsdale Avenue intersection will provide primary access to the industrial portion of the project site.

Unsignalized intersections are analyzed on the basis of the Peak-Hour Volume Signal Warrant, (Warrant #3 – Part B) described in the California *Manual on Uniform Traffic Control Devices* (MUTCD), 2010 Edition. This method makes no evaluation of intersection level of service, but simply provides an indication whether peak-hour traffic volumes are, or would be, sufficient to justify installation of a traffic signal.

Peak hour signal warrants were checked at the Old Hillsdale Avenue and Hillsdale Avenue intersection under each of the scenarios analyzed. The results indicate that the unsignalized study intersection of Old Hillsdale Avenue and Hillsdale Avenue intersection is projected to have traffic volumes that meet the thresholds that warrant signalization under background plus project conditions. The peak-hour signal warrant sheets are contained in Appendix E.

## Freeway On-Ramp Analysis

An analysis of the freeway on-ramps serving the project site was performed in order to identify potential project impacts on queue lengths and ramp operations. The project will be served by two freeway interchanges: SR 87 and Narvaez Avenue/Capitol Expressway and SR 87 and Curtner Avenue. As described under existing conditions, maximum observed queue lengths and their corresponding wait times were used as the basis for this analysis. A ratio between the background volumes using each of the freeway on-ramps and the project trips was used to estimate the number of vehicles that would be added to the background queue under project conditions. It should also be noted that these projections are based on the longest queues observed at the on-ramps during a one hour period, which represent a worst case scenario. The results of the ramp analysis under project conditions are summarized in Table 14.

### SR 87 Northbound On-Ramp and Narvaez Avenue

The project is not projected to add a significant amount of AM peak hour trips to the SR 87 northbound on-ramp from northbound Narvaez Avenue and will result in the reduction of trips by 65 AM peak hour trips from southbound Narvaez Avenue. The reduction of AM Peak-Hour trips at the SR 87 northbound on-ramp from Narvaez Avenue is due to the redistribution of traffic created by the construction of the Communications Hill Boulevard bridge and connection to Curtner Avenue. A portion of the traffic that is currently using the SR 87 Narvaez ramp is expected to change travel patterns and instead utilize the SR 87 northbound on-ramp at Curtner Avenue. Once a connection from the project site to Curtner Avenue is built, the majority of project traffic bound for northbound SR 87 would use the freeway on-ramp at Curtner Avenue, since it provides for shorter travel distances when compared to the SR 87 ramp at Narvaez Avenue.

**Table 14**  
**Freeway Ramp Operations Summary**

| Ramp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Peak Hour | Background |                     |                     | Background Plus Project |                     |                        |

| SR 87 NB on-ramp @ EB Curtner                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | AM        | 222        | 54                  | 09:27               | 148                     | 34                  | 01:48                  |
| Notes:<br><sup>1</sup> The reported northbound and southbound Narvaez queues at SR 87 includes 34 vehicles on the loop ramp (from the meter to the signal).<br><sup>2</sup> Background and project conditions queue lengths were estimated based on the ratio between the existing volumes on the ramp and the estimated approved and project trips added to the ramp.<br><sup>3</sup> The analysis assumes that the metering rate at the Curtner Avenue ramp will be adjusted to match that currently used at the Narvaez Avenue ramp |           |            |                     |                     |                         |                     |                        |

Improvements are planned as part of the CHSPADP, as described in Chapter 5, at the SR 87 northbound on-ramp from Narvaez Avenue. The improvements will provide for additional vehicular storage capacity, improve operations at the Narvaez Avenue and SR 87 ramps intersection, and provide new and enhanced existing pedestrian and bicycle facilities near the ramps. However, delays would continue to be experienced during the AM peak hour at the northbound SR 87 on-ramp. The ramp operations and delays are dictated by the ramp meter service rate. In order to reduce delay time at the ramp, the meter would have to be adjusted to provide a higher service rate and traffic flow onto the freeway. The proposed improvements will not change the existing meter service rates which are controlled by Caltrans not the City of San Jose.

### **SR 87 Northbound On-Ramp and Curtner Avenue**

At the SR 87 northbound on-ramp at Curtner Avenue, the project is projected to add approximately 225 trips to the freeway on-ramp from westbound Curtner Avenue. The additional traffic will result in an increase of the projected queue length by approximately 45 vehicles and cause the wait time at the ramp to increase. The metering rate at the Curtner Avenue northbound on-ramp is currently three times longer than the rate at the Narvaez Avenue northbound on-ramp. The analysis of the freeway ramp assumes that the current metering rate at the SR 87 northbound on-ramp from Curtner Avenue would be increased to serve the increase in demand at the ramp and balance the usage of the Narvaez Avenue and Curtner Avenue ramps. Caltrans controls the metering rate on freeway ramps. Presumably the existing metering rate at the Curtner Avenue northbound on-ramp is based on the current demand which is 50% less than that at the Narvaez Avenue northbound on-ramp. The Narvaez Avenue northbound on-ramp currently serves approximately 900 vehicles during the AM peak hour compared with only 460 vehicles at the Curtner Avenue northbound on-ramp.

Improvements are planned as part of the CHSPADP, as described in Chapter 5, at the SR 87 northbound on-ramp from Curtner Avenue. The improvements include the addition of a second mixed-flow lane and extension of the existing HOV lane on the northbound ramp. The addition of a third lane to the on-ramp would provide an additional 700 ft. of queue storage capacity from Curtner Avenue to the existing ramp meter location. In addition to the ramp improvements, the ADP will require the project to widen the westbound direction of Curtner Avenue from two to three lanes from Communications Hill Boulevard to the SR 87 northbound ramps to provide additional storage capacity to serve the projected westbound queue length under project conditions.

## **Roadway Segment Analysis**

A capacity analysis was performed for a select set of primary roadways serving the project area. Traffic operations for the roadways were evaluated by comparing the average daily volumes (ADT) to the threshold capacities for various roadway types identified in the *Highway Capacity Manual, Transportation Research Board 2000 (HCM 2000)*. The HCM 2000 thresholds are based on the local roadway functional classification and these values provide a planning-level analysis of the relative traffic load and approximate capacity on a particular roadway. It is important to note that daily volume thresholds are used for planning purposes and traffic during the peak commute periods may result in worse operations than illustrated by the daily LOS. The City of San Jose does not have a formally adopted roadway segment operating standard. Thus, for the purposes of this analysis, LOS D was used as a guideline for the evaluation of daily segment volumes.

The ADT volumes for the roadways studied and the resulting level of service are summarized in Table 15. The ADT level of service analysis indicates that the segment of Curtner Avenue between SR 87 and Communications Hill Boulevard is projected to have ADT volumes that exceed the thresholds for LOS D operations. The projected ADT and resulting levels of service, indicate the need to widen Curtner Avenue between SR 87 and Communications Hill Boulevard. The CHSPADP, as described in Chapter 5, will require the project to widen westbound Curtner Avenue from two to three lanes between Communications Hill Boulevard and SR 87. The remaining roadway segments evaluated are projected to have ADT volumes that fall below the HCM 2000 maximum ADT thresholds for operations of LOS D.

**Table 15**  
**Roadway Segment Analysis Summary**

| Roadway                       | Between                                                         | Type                      | Background Plus Project |       |       |       |        |        |        |                  |

| Communications Hill Boulevard | North of Hillsdale Ave                                          | 4-lane divided arterial   | 247                     | 278   | 322   | 232   | 3,220  | 2,780  | 6,000  | C                |
|                               | South of Curtner Ave                                            | 4-lane divided arterial   | 1,123                   | 983   | 1,021 | 960   | 11,230 | 9,830  | 21,060 | D                |
| Narvaez Avenue                | South of Hillsdale Ave                                          | 2-lane collector          | 415                     | 426   | 420   | 286   | 4,200  | 4,260  | 8,460  | D                |

<sup>1</sup>The LOS capacity thresholds are based on HCM 2000 methodology.

### ***Pullman Way Extension***

The extension of the existing Pullman Way to provide an additional access point to the project area was identified within the Communications Hill Specific Plan. The Pullman Way extension was planned to connect Communications Hill Boulevard (along the northeast part of the project site) with Monterey Road to the east of the project area.

The traffic model was utilized to assign project conditions traffic volumes without and with the Pullman Way extension as analyzed in this study. A comparison of intersection level of service analysis results without and with the planned Pullman extension indicates that there is no significant benefit to providing the extension in regards to improved intersection levels of service. However, operational issues such as lengthy vehicle queues at the other primary access points to the general Communications Hill area were identified that may be partially alleviated with the Pullman Way extension.

However, the Pullman way extension would not create significant improvement in overall traffic conditions and circulation on the roadway system. Furthermore, construction of the Pullman Way extension would require significant cut-and-fill, construction of several large retaining walls, and a travel route that is circuitous due to the change in grades that are required to construct this connection. The proposed connections from the project area to Capitol Expressway and Curtner Avenue, with the identified improvements, would accommodate the projected traffic volumes.

## **Transit, Pedestrian and Bicycle Analysis**

The project site is located between two major transit opportunities. The Capitol and Curtner LRT stations are located along SR 87 approximately one mile from the project site. The Capitol Caltrain station is located at the intersection of Monterey Road and Fehren Drive. Currently there is no direct access point to the Capitol Caltrain Station from the project site. Access to the station requires the use of the Capitol Expressway overcrossing of Monterey Highway and a route that is approximately 2.25 miles and includes the use of Snell Avenue, Capitol Expressway, and Monterey Highway. In addition, the project site is not served directly by any bus services. The nearest bus stops are located at the base of the hill near the intersections of Communications Hill Boulevard/Curtner Avenue and Capitol Expressway/Vistapark Drive.

Currently, there are no existing pedestrian/bike links between the project site and other existing pedestrian/bike and transit facilities in the area. The CHSPADP, as described in detail in Chapter 5, will require the project to construct new non-auto facilities as well as enhance existing facilities, as previously described. The improvements are intended to promote and encourage the use of multi-modal travel options and reduce the identified project impacts to the roadway system. The improvements will provide the project site with improved connections to surrounding pedestrian/bike and transit facilities and a balanced transportation system as outlined in the Envision 2040 General Plan goals and policies.

## **On Site Traffic Operations Analysis**

Figure 2 presents the preliminary plan for the proposed residential portion of the project site and includes the on-site roadway network layout. With implementation of the future roadways presented in Figure 2, several new intersections will be created. The on-site operations analysis included an evaluation of necessary intersection control and lane configurations at each of the major on-site intersections. The analysis was completed for background plus project traffic conditions. Projected traffic volumes are presented in Figure 12. The recommended intersection control and lane configurations are presented in Figure 13 are based on the evaluation of background plus project traffic conditions.

Based on the projected traffic volumes and planned roadway alignment the following intersection control, lane configurations, and turn restrictions are recommended at each of the new major intersections on the project site.

- (1) **Communications Hill Boulevard and Altino Boulevard** – Peak hour signal warrant analysis indicates that the Communications Hill Boulevard and Altino Boulevard intersection is projected to have traffic volumes that meet the thresholds that warrant signalization.
- (2) **Communications Hill Boulevard and St. Florian Way** – Peak hour signal warrant analysis indicates that the Communications Hill Boulevard and St. Florian Way intersection is projected to have traffic volumes that meet the thresholds that warrant signalization.
- (3) **Communications Hill Boulevard and Lina Street** – Peak hour signal warrant analysis indicates that the Communications Hill Boulevard and Lina Street intersection is not projected to have traffic volumes that meet the thresholds that warrant signalization. It is recommended that stop-control on the minor street (Lina Street) be implemented at the intersection.
- (4) **Communications Hill Boulevard and Main Street** – A traffic circle is proposed at the Communications Hill Boulevard and Main Street intersection. The proposed traffic circle will reduce potential speed and sight distance issues due to the horizontal and vertical alignment of Communications Hill at its intersection with Main Street.
- (5) **Main Street and St. Florian Way** – Peak hour signal warrant analysis indicates that the Main Street and St. Florian Way intersection is not projected to have traffic volumes that meet the thresholds that warrant signalization. It is recommended that stop-control on all legs be implemented.

In addition, the existing connection of Casselino Drive to Communications Hill Boulevard will be converted to an intersection of the two streets. Based on the projected traffic volumes and peak hour signal warrants, the new intersection is not projected to have traffic volumes that meet the thresholds that warrant signalization. However, similar, to the new Communications Hill Boulevard and Main Street intersection, it is likely that the horizontal and vertical alignment of Communications Hill at its intersection with Casselino Drive will result in speed and sight distance issues that may create unsafe conditions. Therefore, the implementation of a traffic circle at the intersection should be considered.

Traffic volumes and signal warrant analysis sheets for each of the new intersections are included in Appendix F.

## Parking

Based on the City of San Jose's parking code requirements for single-family residences (Municipal Code 20.90.060) the development should provide 2 covered spaces per residential unit. The number of required parking spaces for multi-family units varies based on the number of bedrooms provided in each unit. Additionally, for retail space, the City of San Jose requires a minimum of 1 parking space per 500 s.f. of retail space. Based on the standard City parking requirements, a total of approximately 4,326 off-street parking spaces for the proposed 2,300 residential units and 130 parking spaces for the proposed 64,800 s.f. of retail space will be required for the proposed project. The project proposes to provide 4,307 spaces for the proposed 2,300 residential units and 198 parking spaces for the proposed 64,800 s.f. of retail space. Therefore, the project will provide adequate off-street parking to accommodate resident vehicles, visitors, and retail demand. In addition, approximately 1,400 on-street parking spaces will be available within the project site along new streets to be constructed as part of the project site indicates.

## School Loading

The proposed project will include the dedication of land for a future school within the residential portion of the project. The identified school site will be bound by Communications Hill Boulevard to the north, an extension of the existing Lina Street to the east, and the proposed new Main Street to the south. It is not feasible to provide school driveways along Lina Street due to steep grades along the street. Therefore, school loading (ingress/egress to school loading zones and parking) must be provided along Main Street.

**Recommended On-Site Intersection Control**

## 7. Conclusions

---

The potential impacts of the project were evaluated in accordance with the standards set forth by the City of San Jose and the Congestion Management Program (CMP) of Santa Clara County. The study included the analysis of AM and PM peak hour traffic conditions for 82 signalized intersections, one unsignalized intersection, and 56 directional freeway segments. Project impacts on other transportation facilities, such as bicycle facilities and transit service, were determined on the basis of engineering judgment.

### Project Impacts and Mitigation Measures

#### *Background Plus Project Intersection Level of Service Analysis*

The results show that based on the City of San Jose significance criteria, four of the study intersections would be significantly impacted by the project.

- 3 Monterey Road and Curtner Avenue\*
- 13 Almaden Expressway and Foxworthy Avenue
- 22 Communications Hill Boulevard and Curtner Avenue
- 33 Snell Avenue and Capitol Expressway\*

Two of the four intersections identified to be significantly impacted by the project based on City of San Jose criteria are CMP designated intersections. The two CMP intersections are projected to meet the CMP LOS standard of LOS E.

Potential physical improvements were identified at each of the impacted intersections and are described in detail in Chapter 5. However, each of the identified improvements will require the acquisition of right-of-way that is not currently available. Thus, in lieu of the identified physical mitigations, which are infeasible, this project relies on the adoption of an Area Development Policy (ADP) will be developed to establish special traffic level of service standards for a specific geographic area; the Communications Hill Specific Plan area. Impacts at these intersections would be significant and unavoidable due to the lack of feasible mitigation to reduce these impacts to a less than significant level.

The ADP would provide new and enhanced non-auto travel mode facilities such as trails, bikeways, connections to transit, and improvements on major roadways and freeway entrances. While these improvements would not reduce the identified intersection impacts to a less than significant level, they are consistent with General Plan goals and policies that seek to maximize the efficiency, safety, and

connectivity of the existing street system while promoting complete streets that provide for pedestrian, bicycle, and public transit modes of travel. The planned improvements included in the Communications Hill Specific Plan ADP are described in the following section.

### ***Communications Hill Area Development Policy***

The Communications Hill Specific Plan Area Development Policy (CHSPADP) will provide for the implementation of several improvements to the roadway system, transit system, and pedestrian and bicyclist facilities in the immediate area of the proposed project. The purpose of the ADP is to establish a variance from the City's standard Level of Service Policy to allow for a balanced transportation system as identified by goals and policies of the City of San Jose Envision 2040 General Plan. The Envision 2040 General Plan allows for exceptions to the City's standard Level of Service Policy with the establishment of an ADP with the intent to meet City of San Jose Transportation Policies. In particular, the CHSPADP provides for improvement to the transportation system to meet the City of San Jose Transportation Policies that provide for the following:

- Encourage the use of non-automobile travel modes to reduce vehicle miles traveled (VMT)
- Consider the impact on the overall transportation system when evaluating the impacts of new developments.
- Increase substantially the proportion of travel modes other than single-occupant vehicles.

Rather than constructing improvements that enhance vehicular capacity at isolated intersections located outside of the immediate project area that are of little benefit to the overall roadway system, the CHSPADP will provide the mechanism for the implementation and funding of improvements to the transportation system in the immediate area of the project site. The CHSPADP includes improvements to primary access points to the freeway system and major roadways, new connections to existing transit services, and the enhancement of pedestrian and bicycle facilities to serve the proposed project as well as the existing neighborhoods in the project area and reduce further demand on other local roadways.

Although the project is not proposing to mitigate the regional freeway impacts or the selected signalized intersections described above, the project is implementing an extensive list of improvements that reduce the significant traffic impacts and provide transportation options for the project. These improvements are intended to make the most of the unique transit opportunities afforded the site.

Right-of-way, encroachment permits, and/or easements from public agencies/jurisdictions may be required for some of the improvements described below. Private property would only need to be acquired to allow access to the pedestrian/bicycle overcrossing of the Caltrain tracks.

As other properties within the CHSP come forward for development, it is expected that they may result in additional impacts at the identified intersections. Subsequent traffic analyses would be required to determine participation in the ADP. Each of the ADP improvements and benefits of their implementation is discussed below.

### **Curtner Avenue Corridor Improvements**

Curtner Avenue serves as a major east-west arterial that provides access to SR 87 and Almaden Expressway which are primary links to employment lands north of the project area. The Curtner Avenue interchange with SR 87 serves as a major access point from the project area to north and south San Jose.

The addition of project traffic at the intersection of Curtner Avenue and Communications Hill Boulevard would result in a significant impact. Mitigation measures will be implemented to reduce impacts to a less than significant level at the Curtner Avenue and Communications Hill Boulevard intersection as part of this ADP. Other improvements are included as part of the ADP to reduce other impacts of the project, as described below.

In addition, project traffic will contribute to deficient operations at the Curtner Avenue and SR 87 northbound on-ramp. Thus, improvements along the Curtner Avenue corridor that will provide additional

capacity to serve project traffic, as well as alleviate congestion along other roadways and intersections in the project area, were identified by the City and will be included as part of the ADP.

In particular, the planned improvements to the SR 87 ramps are expected to reduce congestion and operational issues currently experienced at both the Narvaez Avenue/Capitol Expressway and Curtner Avenue on-ramps. The Envision 2040 General Plan identifies the need to widen Curtner Avenue between Communications Hill Boulevard and SR 87 from its existing four to six lanes. The CHSPADP will provide for the widening of Curtner Avenue in the westbound direction along with specific intersection improvements as described below.

**ADP Improvement 1: Widen Curtner Avenue to Five Lanes Between Communications Hill Boulevard and the Almaden Expressway Southbound Off-Ramp**

- Remove existing four-foot wide median and replace with two-foot wide median across existing Curtner Avenue Bridge over the railroad tracks.
- Re-stripe westbound Curtner Avenue lanes from Communications Hill Boulevard to SR 87 on-ramp to accommodate additional through lane.
- Convert westbound lane from Communications Hill Boulevard into dedicated right-turn lane at SR 87 northbound on-ramp.
- Existing Curtner Avenue Bridge over the railroad tracks to remain in place and proposed improvements shall occur within the existing right-of-way.
- Re-stripe Curtner Avenue under SR 87 overpass to improve alignment.
- Modify existing median.
- Maintain existing Class II bicycle lane along Curtner Avenue by restriping it between Communications Hill Boulevard and the Curtner Avenue Bridge over the railroad tracks.

**ADP Improvement 2: Intersection of Communications Hill Boulevard and Curtner Avenue**

- Add second westbound left-turn lane from Curtner Avenue onto southbound Communications Hill Boulevard upon modification of existing median.
- Restripe existing westbound right-turn lane onto northbound Communications Hill Boulevard to accommodate an additional through lane upon removal of existing pork chop islands.
- Remove pork chop islands, reduce radius returns on both north and south sides of Curtner Avenue, modify traffic signal including new poles, mast arms, pedestrian facilities, and restriping.

**ADP Improvement 3: Intersection of SR 87 Northbound Off-Ramp and Curtner Avenue**

- Modify traffic signal including new mast arm poles, upgrades to pedestrian facilities, and restriping.
- Right-of-way on the south side to be acquired by the City from Caltrans.

**ADP Improvement 4: SR 87 Northbound On-Ramp at Curtner Avenue**

- Add second eastbound left-turn lane from Curtner Avenue onto the SR 87 northbound on-ramp.
- Modify the existing median island at the SR 87 and Curtner Avenue intersection.
- Extend the existing HOV lane on the on-ramp back to Curtner Avenue and provide additional mixed-flow lane on the ramp from Curtner to metering light for a total of three lanes on the ramp. This may require additional right-of-way on the east side of SR 87 between Unified Way and the metered on-ramp for approximately 200' feet.
- Add Class I bicycle facility to shoulder along Unified Way. Construct 10-foot paved trail with two-foot shoulders from existing path terminus at bus yard driveway to the corner of Unified Way and Curtner Avenue.
- Install traffic signal at Unified Way at Bus Yard
- CALTRANS to relinquish Unified Way and right-of-way along Curtner Avenue to City of San Jose.
- These improvements require an encroachment permit from CALTRANS

### **Capitol Expressway/Narvaez Avenue/SR 87 On/Off Ramps**

The SR 87 freeway ramps at Capitol Expressway and Narvaez Avenue serve as the primary freeway access point and link between the residential land uses in the project area with employment centers north of the project area. The SR 87 on-ramp at Narvaez Avenue currently experiences lengthy queues during the AM peak hour when ramp metering is active.

Although it is projected that the primary freeway access point for the proposed project will be provided by the Curtner Avenue interchange with SR 87 and that the project traffic will have a minimal effect on the SR 87 ramps at Narvaez Avenue, the developer has voluntarily included improvements to this interchange as part of its application for development to the City to alleviate other traffic issues in the vicinity of the project because not all project impacts could be mitigated. These improvements are included in this policy. Improvements have been identified to increase vehicular queue storage at the Narvaez on-ramp in an effort to alleviate operational issues near the freeway ramps. The planned improvements in the vicinity of the Capitol Expressway/Narvaez Avenue/SR 87 On/Off Ramps are discussed below.

#### **ADP Improvement 5: Improvement to the SR 87 On-Ramp/Narvaez Avenue Corridor**

- Widen Narvaez Avenue from Capitol Expressway northerly to the SR 87/Narvaez on/off ramps to extend two existing northbound through lanes on Narvaez Avenue to the SR 87 northbound on/off ramps.
- Reconfigure the intersection at the SR 87 northbound on/off ramps to improve the intersection operations, queuing for both northbound and southbound Narvaez Avenue, and construction of a retaining wall adjacent to the existing VTA parking lot.
- Modify full traffic signal including improved pedestrian and bike facilities at the SR 87 on/off ramps.
- Modify traffic signal at the intersection of Capitol Expressway and Narvaez Avenue.
- These improvements require an encroachment permit from the County and Caltrans.
- These improvements may require additional right-of-way between the SR 87 ramps and Capitol Expressway at the VTA parking lot (approximately ½ acre).

### **Public Transit/Pedestrian/Bike Improvements**

Although the project area is served by several major public transit lines (Caltrain and VTA bus lines and LRT), the project site itself is not served directly by any transit services. In addition, there are no existing pedestrian/bicycle links between the project site and other existing pedestrian/bicycle and transit facilities in the area. The CHSPADP includes several improvements to existing, as well as the construction of new, non-auto facilities with the intent to promote and encourage the use of multi-modal travel options. The identified improvements are consistent with the Envision 2040 General Plan goals and policies that are dedicated to the enhancement of the transportation infrastructure, including public transit and pedestrian/bike facilities. The Transportation Policies contained in the General Plan create incentives for non-auto modes of travel while reducing the use of single-occupant automobile travel as generally described below:

- Through the entitlement process for new development, fund needed transportation improvements for all transportation modes, giving first consideration to improvement of bicycling walking, and transit facilities.
- Give priority to the funding of multimodal projects to provide the most benefit to all users of the transportation system.

Thus, the implementation of the improvements discussed below are intended to reduce the identified project impacts to the roadway system by providing the project site with viable connections to surrounding pedestrian/bike and transit facilities and provide for a balanced transportation system as outlined in the Envision 2040 General Plan goals and policies..

**ADP Improvement 6: Bicycle and Pedestrian Facility Improvements (Unified Way to Masonic Drive)**

- Construct a Class I bicycle facility (10 feet paved with two-foot shoulders) from trail terminus at Unified Way southerly crossing at SR 87/Curtner Avenue northbound off/on ramp intersection and continuing along the east side of SR 87 ending at Millpond Drive/Masonic Drive.
- Construct a Class I bicycle/pedestrian facility (10 feet paved with two-foot shoulders) from Millpond Drive south along the east side of SR 87 to Carol Drive. This will require the construction of a retaining wall along the east side of the trail.

**ADP Improvement 7: Bicycle and Pedestrian Facility Improvements (Azores Street to Capitol Expressway)**

- Stripe Class II bike lanes along Narvaez Avenue from existing trail terminus at Azores Street/Helzer Road southerly within the existing right-of-way on Narvaez Avenue. Continue the Class II bicycle lane along the newly constructed/widened Narvaez Avenue from the SR 87 off/on ramps to Capitol Expressway.
- The traffic signal at Narvaez Avenue and the SR 87 on/off ramps will be modified to include improved bike/pedestrian crossing.
- This will require right-of-way from the existing VTA parking lot on the west side of Narvaez Avenue.

**ADP Improvement 8: CALTRAIN Pedestrian/Bicycle Connection along Monterey Highway**

Access from the Communications Hill 2 project site to the Capitol Caltrain Station on the east side of the railroad tracks adjacent to Monterey Road can be acquired by way of three options. These options were developed because property would need to be obtained from private property owners. Option #1 assumes the crossing would be located north of the existing Capitol Caltrain Station. The overcrossing location for Options #2 and #3 would be approximately the same; adjacent to or very near the existing Station. The design of the crossing itself would be the same regardless of the access location. These options are generally described below.

**Option #1 Alignment**

- Construct approximately 400 linear feet of sidewalk or pathway from the project site to the western landing of the future overcrossing to be located north of the existing Capitol Caltrain Station.
- Construct a pedestrian/bicycle overcrossing between the end of the sidewalk/pathway and the existing sidewalk on the east side of the railroad tracks. The sidewalk on the east side of the railroad tracks along Monterey Road would be utilized to access the Station.
- Requires right-of-way (easement) from at least one private property owner.
- Requires coordination/permit from the Joint Powers Board

**Option #2 Alignment**

- Construct approximately 1,200 linear feet of pathway or trail from the project site to the western landing of the overcrossing to the Caltrain Station. A portion of this trail would run along the east side of the railroad tracks.
- Construct a pedestrian/bicycle overcrossing between the end of the pathway/trail and the Station.
- Requires easement from at least two private property owners.
- Requires coordination/permit from the Joint Powers Board.

**Option #3 Alignment**

- Utilize existing public streets and sidewalks south of the project site to the extent possible to access the future overcrossing. This would require the construction of approximately 2,200 linear feet of new sidewalks from the project site along Hillcap and Hillsdale Avenues and Granite Rock

Way. At the terminus of Granite Rock Way, an approximately 400-foot long pathway/trail would be constructed to the western landing of the overcrossing. Construct a pedestrian/bicycle overcrossing between the end of the pathway/trail and the Station.

### ***Background Plus Project Freeway Segment Level of Service Analysis***

The results of the freeway segment analysis show that, based on the CMP freeway segment criteria, the project will have a significant impact on mixed-flow lanes on 10 directional freeway segments and HOV lanes on two directional freeway segments during at least one peak hour.

The Valley Transportation Authority *VTP 2035* identifies improvements to regional facilities, including freeways, for which a regional funding plan could be used to fund. The Silicon Valley Express Lanes Program, is identified in the *VTP 2035* and will convert existing carpool lanes and add new lanes to provide congestion relief throughout Santa Clara County. The Silicon Valley Express Lanes Program and *VTP 2035* identify improvement of the following impacted freeway segments:

- SR 87 Express Lanes, between SR 85 and US 101
- I-280 Express Lanes, between US 101 and Leland Avenue
- I-680 Express Lanes, between Calaveras Boulevard and US 101

The project along with other projects within Santa Clara County could contribute towards the funding of the improvements. However, full mitigation of significant project impacts on freeway segments is not feasible for an individual development project to bear responsibility for implementing such extensive transportation system improvements. Therefore, significant impacts on the directional freeway segments identified above must be considered significant and unavoidable.

As discussed above, the CHSPADP includes several improvements to existing as well as the construction of new non-auto facilities with the intent to promote and encourage the use of multi-modal travel options to reduce the use of single-occupant automobile travel. The implementation of the improvements are intended to reduce the identified project impacts to the roadway system, including freeways, by providing the project site with viable connections to surrounding pedestrian/bike and transit facilities.

## **Other Transportation Issues**

### ***Intersection Operations Analysis***

The following intersections would have inadequate queue storage capacity under project conditions.

#### **(13) Almaden Expressway and Foxworthy Avenue**

*Recommendation:* The recommended improvement for the intersection of Almaden Expressway and Foxworthy Avenue is to extend the left-turn lanes on the southbound approach to provide an additional 350 feet of total storage capacity to accommodate the projected queues. The improvement will require removal and reconstruction of the median island along the southbound leg of the intersection and restriping of the lanes.

#### **(22) Communications Hill Boulevard and Curtner Avenue**

*Recommendation:* The improvements for the intersection of Communications Hill Boulevard and Curtner Avenue included in the ADP will provide a second left-turn lane on the westbound approach to provide a total queue storage capacity of 650 ft. The improvement includes the removal of the “pork chop” islands at the southern side of the intersection, relocation of the existing traffic signal, and restriping of the lanes. There are no further feasible improvements to implement on the northbound approach to the intersection. Implementation of the ADP will improve operational deficiencies at this intersection.

### **(32) Vistapark Drive and Capitol Expressway**

*Recommendation:* The recommended improvements for the intersection of Vistapark Drive and Capitol Expressway is to extend the left-turn lanes on the southbound and eastbound approaches by 25 feet to accommodate the projected queues. These improvements will require removal and reconstruction of median islands along the north and west legs of the intersection and restriping of the lanes. The City has the discretion to include this improvement in the ADP.

### **(33) Snell Avenue and Capitol Expressway**

*Recommendation:* The recommended improvements for the intersection of Snell Avenue and Capitol Expressway is to provide a third left-turn lane on the southbound approach to provide a total queue storage capacity of 975 ft. The improvement will require right-of-way from adjacent properties, removal of the “pork chop” islands at the northern and southern sides of the intersection, relocation of the existing traffic signal, and restriping of the lanes. These improvements are not currently feasible due to a lack of right-of-way.

### ***Unsignalized Intersection Analysis (Traffic Signal Warrants)***

Peak hour signal warrants were checked at the Old Hillsdale Avenue and Hillsdale Avenue unsignalized study intersection under each of the scenarios analyzed. The results indicate that the unsignalized study intersection of Old Hillsdale Avenue and Hillsdale Avenue intersection is projected to have traffic volumes that meet the thresholds that warrant signalization under background plus project conditions without and with the Pullman Way extension.

### ***Freeway On-Ramp Analysis***

An analysis of the freeway on-ramps serving the project site was performed in order to identify potential project impacts on queue lengths and ramp operations. The project will be served by two freeway interchanges: SR 87 and Narvaez Avenue/Capitol Expressway and SR 87 and Curtner Avenue.

#### **SR 87 Northbound On-Ramp and Narvaez Avenue**

The project is not projected to add a significant amount of AM peak hour trips to the SR 87 northbound on-ramp from northbound Narvaez Avenue and will result in the reduction of trips by 65 AM peak hour trips from southbound Narvaez Avenue. The reduction of AM Peak-Hour trips at the SR 87 northbound on-ramp from Narvaez Avenue is due to the redistribution of traffic created by the construction of the Communications Hill Boulevard bridge and connection to Curtner Avenue. A portion of the traffic that is currently using the SR 87 Narvaez ramp is expected to change travel patterns and instead utilize the SR 87 northbound on-ramp at Curtner Avenue. Once a connection from the project site to Curtner Avenue is built, the majority of project traffic bound for northbound SR 87 would use the freeway on-ramp at Curtner Avenue, since it provides for shorter travel distances when compared to the SR 87 ramp at Narvaez Avenue.

Improvements are planned as part of the CHSPADP, as described in Chapter 5, at the SR 87 northbound on-ramp from Narvaez Avenue. The improvements will provide for additional vehicular storage capacity, improve operations at the Narvaez Avenue and SR 87 ramps intersection, and provide new and enhanced existing pedestrian and bicycle facilities near the ramps. However, delays would continue to be experienced during the AM peak hour at the northbound SR 87 on-ramp. The ramp operations and delays are dictated by the ramp meter service rate. In order to reduce delay time at the ramp, the meter would have to be adjusted to provide a higher service rate and traffic flow onto the freeway. The proposed improvements will not change the existing meter service rates which are controlled by Caltrans not the City of San Jose.

#### **SR 87 Northbound On-Ramp and Curtner Avenue**

At the SR 87 northbound on-ramp at Curtner Avenue, the project is projected to add approximately 225

trips to the freeway on-ramp from westbound Curtner Avenue. The additional traffic will result in an increase of the projected queue length by approximately 45 vehicles and cause the wait time at the ramp to increase. The metering rate at the Curtner Avenue northbound on-ramp is currently three times longer than the rate at the Narvaez Avenue northbound on-ramp. The analysis of the freeway ramp assumes that the current metering rate at the SR 87 northbound on-ramp from Curtner Avenue would be increased to serve the increase in demand at the ramp and balance the usage of the Narvaez Avenue and Curtner Avenue ramps. Caltrans controls the metering rate on freeway ramps. Presumably the existing metering rate at the Curtner Avenue northbound on-ramp is based on the current demand which is 50% less than that at the Narvaez Avenue northbound on-ramp. The Narvaez Avenue northbound on-ramp currently serves approximately 900 vehicles during the AM peak hour compared with only 460 vehicles at the Curtner Avenue northbound on-ramp.

Improvements are planned as part of the CHSPADP, as described in Chapter 5, at the SR 87 northbound on-ramp from Curtner Avenue. The improvements include the addition of a second mixed-flow lane and extension of the existing HOV lane on the northbound ramp. The addition of a third lane to the on-ramp would provide an additional 700 ft. of queue storage capacity from Curtner Avenue to the existing ramp meter location. In addition to the ramp improvements, the ADP will require the project to widen the westbound direction of Curtner Avenue from two to three lanes from Communications Hill Boulevard to the SR 87 northbound ramps to provide additional storage capacity to serve the projected westbound queue length under project conditions.

### **Roadway Segment Analysis**

A capacity analysis was performed for a select set of primary roadways serving the project area. Traffic operations for the roadways were evaluated by comparing the average daily volumes (ADT) to the threshold capacities for various roadway types identified in the *Highway Capacity Manual, Transportation Research Board 2000 (HCM 2000)*. The HCM 2000 thresholds are based on the local roadway functional classification and these values provide a planning-level analysis of the relative traffic load and approximate capacity on a particular roadway. It is important to note that daily volume thresholds are used for planning purposes and traffic during the peak commute periods may result in worse operations than illustrated by the daily LOS. The City of San Jose does not have a formally adopted roadway segment operating standard. Thus, for the purposes of this analysis, LOS D was used as a guideline for the evaluation of daily segment volumes.

The ADT level of service analysis indicates that the segment of Curtner Avenue between SR 87 and Communications Hill Boulevard is projected to have ADT volumes that exceed the thresholds for LOS D operations. The projected ADT and resulting levels of service, indicate the need to widen Curtner Avenue between SR 87 and Communications Hill Boulevard. The CHSPADP, as described in Chapter 5, will require the project to widen westbound Curtner Avenue from two to three lanes between Communications Hill Boulevard and SR 87. The remaining roadway segments evaluated are projected to have ADT volumes that fall below the HCM 2000 maximum ADT thresholds for operations of LOS D.

### **Pullman Way Extension**

The extension of the existing Pullman Way to provide an additional access point to the project area was identified within the Communications Hill Specific Plan. The Pullman Way extension was planned to connect Communications Hill Boulevard (along the northeast part of the project site) with Monterey Road to the east of the project area.

The traffic model was utilized to assign project conditions traffic volumes without and with the Pullman Way extension as analyzed in this study. A comparison of intersection level of service analysis results without and with the planned Pullman extension indicates that there is no significant benefit to providing the extension in regards to improved intersection levels of service. However, operational issues such as lengthy vehicle queues at the other primary access points to the general Communications Hill area were identified that may be partially alleviated with the Pullman Way extension.

However, the Pullman way extension would not create significant improvement in overall traffic conditions and circulation on the roadway system. Furthermore, construction of the Pullman Way extension would require significant cut-and-fill, construction of several large retaining walls, and a travel route that is circuitous due to the change in grades that are required to construct this connection. The proposed connections from the project area to Capitol Expressway and Curtner Avenue, with the identified improvements, would accommodate the projected traffic volumes.

### ***Transit, Pedestrian and Bicycle Analysis***

The project site is located between two major transit opportunities. The Capitol and Curtner LRT stations are located along SR 87 approximately one mile from the project site. The Capitol Caltrain station is located at the intersection of Monterey Road and Fehren Drive. Currently there is no direct access point to the Capitol Caltrain Station from the project site. Access to the station requires the use of the Capitol Expressway overcrossing of Monterey Highway and a route that is approximately 2.25 miles and includes the use of Snell Avenue, Capitol Expressway, and Monterey Highway. In addition, the project site is not served directly by any bus services. The nearest bus stops are located at the base of the hill near the intersections of Communications Hill Boulevard/Curtner Avenue and Capitol Expressway/Vistapark Drive.

Currently, there are no existing pedestrian/bike links between the project site and other existing pedestrian/bike and transit facilities in the area. The CHSPADP, as described in detail in Chapter 5, will require the project to construct new non-auto facilities as well as enhance existing facilities, as previously described. The improvements are intended to promote and encourage the use of multi-modal travel options and reduce the identified project impacts to the roadway system. The improvements will provide the project site with improved connections to surrounding pedestrian/bike and transit facilities and a balanced transportation system as outlined in the Envision 2040 General Plan goals and policies.
