

## Appendix G-2

Phase II ESA

April 26, 2013

Mr. Steve Bull  
**KB Home**  
5000 Executive Parkway, Suite 125  
San Ramon, California 94583

Dear Mr. Bull,

We are pleased to submit our Draft Additional Phase II Environmental Sampling Report for the Eastern portion of Communication Hill in San Jose. We look forward to your review and comment. Should you have any questions, please call me at (925)786-2667 or I can be contacted at [tom@mccloskeyconsultants.com](mailto:tom@mccloskeyconsultants.com).

Sincerely,

Thomas F. McCloskey, P.G., C.E.G., C.HG.  
President and Principal Geologist

Copies: Addressee (e-copy)  
Mr. Robert J. Bettencourt (hard copy)

## **1.0 INTRODUCTION**

---

### **1.1 Statement of Purpose**

McCloskey Consultants, Inc. (MCI) was retained by KB Home to perform additional Phase II environmental sampling services on the eastern side of Communication Hill in San Jose, California (Site). The Site location and vicinity map is included as Figure 1. The objective of the additional sampling was to evaluate the reclamation fill soils and mixed stockpiled soils at the Site for the presence of possible contamination related to previous uses as well as naturally-occurring compounds that could represent a concern for the planned future uses of the property. KB Home is planning residential development for portions of the Site, commercial redevelopment is planned for other areas, and a new elementary school is also planned at the Site. Extensive previous sampling was performed on this Site (SES, 2009), and the results of that work are summarized in Section 1.3.

### **1.2 Site Description and Background**

The Site area consists of two parcels totaling approximately 312 acres of land located approximately 4 miles south of downtown San Jose. Most, but not all, of this area is planned to be used for new residential development. A 55-acre area near the southeast corner is currently planned to be later developed for industrial uses. The Site is located on the northeast portion of an elongated bedrock ridge that rises out of the southern portion of the Santa Clara Valley to a maximum elevation of about 425 feet above mean sea level. The northeastern boundary of the Site is marked by a rail line, the southwestern boundary is marked by the Tuscany Hills residential development, and the southern boundary is marked by Hillsdale Avenue (Figure 2).

The Site is currently owned by MTA Properties, and the 55-acre portion in the southeastern corner of the Site is currently leased to a materials recycling company. Most of the land was previously leased to Raisch Products Company (Raisch) before the company recently went bankrupt. Rock quarrying operations were performed historically (since 1973) by Raisch over a large portion of the southern area of the Site which has altered and lowered the natural topography. Quarry reclamation was on-going starting in 1992-93 and continued to late 2009.

A relatively small underground cinnabar mine, known best as the Hillsdale Mine, remains on a portion of the Site. The cinnabar (mercury sulfide) is the result of hydrothermal alteration of the serpentinite bedrock present at the Site. The Hillsdale mine was operational starting as early as the 1850's supplying the gold fields with mercury during the California gold rush. Sporadic small-scale cinnabar mining, or just mine evaluations, appear to have continued into the 1940's. The ore vein, waste rock, and ore crushing and heating areas were evaluated during previous studies for their potential to impact the planned redevelopment. The cinnabar

appears to be associated with white, silica-carbonate bedrock that occurs in the mine area as a narrow, discontinuous lens that is dipping steeply west. Similar lenses are present northwest of this lens but were apparently not mined suggesting they lack concentrated cinnabar.

Serpentinite and serpentized basaltic bedrock is present over large areas of the Site. This type of rock contains naturally-occurring asbestos (NOA). Asbestos fibers are believed to be a health hazard when inhaled or ingested in large amounts typically in an occupational setting, and the safe level of exposure to small amounts has not been established by medical researchers and toxicologists. The control of the release of NOA fibers during grading operations is required by local agencies along with long-term dust control measures such as capping of exposed NOA bedrock. In addition, CalOSHA treats NOA similar to building materials in regards to worker exposure prevention and training requirements. Geologic mapping performed by the project geotechnical engineer has identified where the serpentinite is present (Cornerstone, 2009).

Quarry reclamation activities starting in the early 1990's apparently included capping of exposed bedrock with 1-2 feet of imported fill soils. These soils were obtained by allowing import of soils from local construction projects that had excess soils. The condition of these soils with respect to natural and man-made contaminants was incomplete, and this issue was addressed during the current investigation.

Raisch's final operations at the Site involved only a concrete and asphalt recycling operation. The asphalt has been removed from the Site, but several stockpiles of mixed recycled concrete and imported soil. Additional recent stockpiles in the leased 55-acre portion of the Site also remain on Site. This material appears to be composed only of recycled concrete.

### **1.3 Previous Site Investigations**

An investigation was conducted by Strategic Engineering & Science (SES, 2009) to evaluate the rock, soil, sediment and water at the Site for a number of potential environmental contaminants of concern. The contaminants identified during the investigation at the Site include the following:

- Mercury in bedrock at the mine area and areas northwest of the mine;
- Mercury and nickel in a former ore processing area,
- Petroleum hydrocarbons in fill soils in the northeastern area of the Site,
- Spring water with potentially elevated concentrations of arsenic, nickel, and thallium,
- Methyl mercury in the quarry pond water; and,
- Widespread naturally-occurring asbestos at the Site.

### **1.3.1 Mercury in Bedrock**

The silica-carbonate rock that hosts the cinnabar ore vein outcrops at the surface near the former mine workings and other areas of the Site, and an additional 24 bedrock samples were collected in 2009 to confirm and to supplement the nine earlier samples collected (Terratech, 1991). The testing results show that mercury concentrations exceed the California Human Health Screening Levels (CHHSLs) (Cal/EPA, 2005) for residential use of 18 milligrams per kilogram (mg/kg) at only three locations, and none of the locations exceed the CHHSL for commercial and industrial uses. The hazardous waste threshold of 20 mg/kg was exceeded at two locations in the mine area, and at one location in the extreme northwest corner of the Site. The mercury testing results from the naturally-occurring outcrops were analyzed to obtain the 95% Upper Confidence Limit (UCL) of the data set. The calculation performed is included in Appendix C. The results show that the 95% UCL is 8.2 mg/kg which is well below the residential CHHSL and the hazardous waste concentration. Regulatory agencies generally do not require mitigation if the 95% UCL of the analyte does not exceed regulatory threshold concentrations.

### **1.3.2 Former Ore Processing Area**

A mine map from 1943 showed an ore crusher and furnace located near the former main mine portal, and the slab of this structure is also visible in historic aerial photographs. The ore processing can result in spillage and accumulation of mercury and other metals. A number of borings were completed in the area after elevated mercury and nickel concentrations were identified in initial soil sampling of the area. The detected mercury concentrations exceeded the CHHSLs for residential uses, but not commercial/industrial standards. The nickel concentrations were elevated but did not exceed either standard for direct exposure. Solubility testing showed that nickel from one sample exceeded the hazardous waste concentrations.

Heating of cinnabar to release mercury produces a waste rock called “calcines” that is pink to gray in color and can retain elevated mercury concentrations. Nine exploratory borings were completed and 16 soil samples were collected for mercury analysis of suspect material. Mercury concentrations were detected in the samples collected, but all concentrations were well below the regulatory thresholds and are generally consistent with the typical naturally-occurring background concentrations (Scott, 1991).

### **1.3.3 Petroleum Hydrocarbons in Fill**

The previous Phase I Environmental Site Assessment (SES, 2007) identified former Raisch operations in the area on the eastern side of the Site adjacent to the railroad tracks. Sampling was performed in this area for the presence of residual contamination. In the boreholes were identified thin lenses (6 and 12 inches) of black, petroleum hydrocarbon material 3 to 6 feet

below the surface in two areas. Additional step-out borings were completed to estimate the lateral extent of these lenses. Comprehensive laboratory testing of this material identified only motor oil contamination. The concentrations exceeded the San Francisco Regional Water Quality Control Board (SFRWQCB) thresholds for gross contamination (possible odors) for soils less than 3 meters deep, but not the updated direct exposure for construction workers (SFRWQCB, 2013).

#### **1.3.4 Spring Water Sampling**

Two springs and the quarry pond at the Site were sampled six continuous quarters during the 2009 investigation. One of the springs emanates from the former main haul line portal for the mine, and the other spring is in an area north of the mine and it drains to the quarry pond. Water from inside the mine was also sampled. The sampling results were compared to the very restrictive RWQCB Environmental Screening Levels (ESLs) for surface water screening levels for estuary habitats because this water may be captured by subdrains installed for the future development and eventually be discharged to Coyote Creek and the San Francisco Bay. The only constituents identified at potentially elevated concentrations in the samples collected were arsenic, thallium, and nickel. These metals were most likely naturally occurring and related to the hydrothermally altered and/or ultramafic rocks at the Site.

#### **1.3.5 Quarry Pond Sampling**

Water samples collected from the quarry pond identified methyl mercury concentrations that exceed the SFRWQCB ESLs for surface water screening levels for estuary habitats. Methyl mercury is soluble and is produced in water by sulfate reducing bacteria under low-oxygen conditions when elemental mercury is present in sufficient concentrations. The quarry pond is therefore capable of generating methyl mercury which likely occurs at depth in the pond during the summer months when algae depletes the pond water of oxygen allowing anaerobic conditions to develop resulting in the production of methyl mercury.

#### **1.3.6 Naturally-Occurring Asbestos**

Serpentinite bedrock containing chrysotile asbestos (NOA) is present over large areas of the Site, as shown on the geologic map produced for the geotechnical investigation (Cornerstone, 2009). Five samples were collected from locations distributed throughout the Site and analyzed for NOA. The samples were analyzed by plane light microscopy (PLM) and CARB 435 400 Point Count methods. NOA (as chrysotile) was detected in all five of the bedrock samples analyzed by PLM. Due to the high percentage of fibers in four of the bedrock samples, accurate point counting could not be performed, and therefore an estimate of 20-30 percent NOA, as chrysotile, was reported for the four samples. The concentrations in all of these samples

exceed the Bay Area Air Quality Management District (BAAQMD) limit of 0.25% (State of California ATCM, 2002).

Three additional soil samples were collected from different depths to determine the NOA concentrations at depth in fill and deep colluvium in the northern end of the Site west of the existing Quarry Pond. The samples were analyzed by transmitting electron microscopy (TEM) methods because this test is able to resolve the smaller asbestos fibers that are in soils. Laboratory analyses of deeper, buried colluvium soils in this area detected NOA concentrations of only 0.002 and 0.003 percent. These concentrations are less than the BAAQMD criteria of 0.25% and also the DTSC Schools Division criteria of 0.01%. These soils are therefore suitable for capping of NOA in the bedrock at the Site for any of the planned redevelopment areas. These soils are largely covered by fill soils that contained higher concentrations of NOA which would have to be removed if the deeper soils are to be reused for cover material.

#### **1.4 Current Scope of Work**

The scope of work for the current environmental site sampling included the following tasks:

- Completion of 20 pothole excavations, and collection of soil samples from the capping soils at each location for laboratory analysis;
- Review of current activities in the southeast, 55-acre portion of the Site;
- Additional sampling in the area of the former ore crusher;
- Collection and analysis of soil samples from the six stockpiles located in the lower Site area; and,
- Data analysis and report preparation.

---

## **2.0 SAMPLING AND RESULTS**

---

### **2.1 Quarry Reclamation Fill Soil Sampling**

#### **2.1.1 Sample Collection and Analyses**

During the reclamation of the former Azevedo Quarry, Raisch Products Company placed generally 2 to 3 feet of imported soil to cap over exposed bedrock prior to hydroseeding. No documentation of the sources of the import soil was available and no testing for the presence of contamination appears to have been performed. Based on the Reclamation Report (H.T. Harvey and Associates, May 14, 2008), it was also stated that the reclamation was to be accomplished by spreading serpentine-based topsoil over the quarried areas and subsequent seeding with "locally favorable" native grasses and forbs. The use of the serpentine-based

topsoil in the reclamation process increases the likelihood of NOA-containing soils of being used to cap the bedrock.

To evaluate the soils for the presence of man-made compounds and for NOA, a small track excavator was used to excavate 20 potholes over approximately 130 acres of the planned development. Potholing and sample collection activities were conducted as described in the general field procedures summarized in Appendix A. The sampling locations are shown on Figure 2. With exception of pothole TP-25, which appeared to only be in native soils and bedrock, at least one sample was collected from each of the 20 locations and analyzed for CAM 17 metals (EPA Test Methods 6010/7471), organochlorine pesticides (OCPs) (EPA Test Method 8081) which are persistent compounds that can remain at elevated concentrations for many years. Discolored soil or suspect materials was observed at depth in only one pothole location (TP-10). The soil sample (TP-10 at 11-11½ below ground surface) was also analyzed for semi-volatile organic compounds (EPA Test Method 8270 SIM), and gasoline, diesel and motor oil range total petroleum hydrocarbons (EPA Test Methods 8260 and 8015B with a silica gel clean-up). Fifteen of the samples were analyzed for NOA by plane light microscopy (PLM), CARB 435 1000-Point Count. Samples were not collected for the NOA analysis when serpentine was observed mixed in the fill soils. The sample collected from pothole location TP-19 in the area of the proposed new school was analyzed for NOA by Transmitting electron microscope (TEM) (NOA EPA/CARB Quantitative).

### **2.1.2 Analytical Results**

The laboratory results of the pesticides analysis are summarized in Table 1, metals analyses are summarized in Table 2, petroleum hydrocarbon and semi-volatile compounds analyses are summarized in Table 3, and results of the PLM and TEM analyses are summarized in Table 4. Only those chemicals that exceeded detection limits in at least one sample are included in the summary tables with exception of all the metals included in Table 2. The complete laboratory results are included as Appendix B.

The organochlorine pesticide results show that some of the samples had detectable concentrations of 4,4'-DDD, 4,4'-DDE, and 4,4'-DDT that range from 0.0023 milligrams per kilogram (mg/Kg) up to 0.200 mg/Kg. These concentrations are well below their respective single compound California Human Health Screening Levels (CHHSL) (Cal/EPA, 2005) for residential uses. Alpha chlordane, technical chlordane, and gamma chlordane were also detected in a few of the samples collected but at concentrations well below their respective single compound CHHSL screening levels.

Eleven metals (antimony, arsenic, barium, chromium, cobalt, copper, lead, mercury, nickel, vanadium and zinc) had detectable concentrations from the samples collected from the potholed locations. Except for arsenic and one lead concentration, the metals concentrations were below the CHHSL and TTLC for hazardous waste classification in all soil samples analyzed. Concentrations of arsenic were detected exceeding laboratory detection limits in just two of the soil samples. Arsenic concentrations of 2.2 mg/Kg were detected in both samples. The reported arsenic concentrations exceed the CHHSL for residential land use of 0.07 mg/Kg; however, naturally-occurring arsenic concentrations in this geographic area commonly exceed CHHSLs. Because of this, the recommended acceptable risk management guideline concentration for arsenic in the San Francisco Bay Region (Duverge', 2011) is 12 mg/Kg. None of the arsenic concentrations exceed 12 mg/Kg.

Lead concentrations were detected in every sample collected from the potholes and ranged from 4.5 mg/Kg to 43 mg/Kg with one concentration detected at 80 mg/kg. The lead concentration of 80 mg/Kg matches the CHHSL of 80 mg/Kg. The other lead concentrations generally appear consistent with naturally-occurring concentrations in California.

Slightly elevated concentrations of chromium and nickel are likely associated with the serpentinite rock and regardless the concentrations detected are all less than their respective residential CHHSLs. The other metals concentrations are generally consistent with naturally-occurring concentrations in soils in this area (Scott, 1991).

Low concentrations of TPH as diesel (TPHd) was detected in the soil sample collected from pothole TP-10 (2.0 mg/Kg) at 11 to 11½ feet bsg. Gasoline range petroleum hydrocarbons were not detected exceeding the laboratory reporting limit in any of the samples. Anthracene, 1-methylnaphthalene, 2-methylnaphthalene and phenanthrene were also detected in the TP-10 sample exceeding the laboratory reporting limits. The results were compared to the San Francisco Regional Water Quality Control Board (SFRWQCB) Environmental Screening Levels (ESLs) for shallow soil for the protection of groundwater, gross contamination ceiling value (odors), and direct exposure for residential land uses. None of the concentrations detected in the soil samples exceeded any of their respective ESLs.

Chrysotile fibers were detected exceeding the 0.10% detection limit in five of the 15 cap samples analyzed by the PLM (CARB 435 1,000 Point Count) method. Three of the concentrations detected exceed the Bay Area Air Quality Management District (BAAQMD) limit of 0.25% (State of California, 2002) and therefore a Dust Mitigation Plan is required to be submitted and approved by the BAAQMD. The plan must describe dust control measures during grading as well as long term dust control measures.

NOA (as chrysotile) was detected by the TEM method in the soil sample from pothole TP-19 at 0.30 percent. This location corresponds to the future school area. The sample exceeded the Department of Toxic Substance Control (DTSC) Schools Program screening level of 0.01 percent NOA in over 25% of the samples, which triggers additional mitigation measure if the school will utilize State funds for construction or future funding needs.

## **2.2 Stockpiled Material in the Lower Quarry Area Sampling**

### **2.2.1 Sample Collection and Analyses**

Six stockpiles are located in the lower quarry area and are composed of mixed aggregate and soils. We understand that this material would potentially be reused at the Site. To evaluate the stockpiles for contamination, we collected composite samples from each stockpile for lab analyses. The number of composite samples collected was based on the approximate size of the stockpile. We collected four, 4-point composites from the largest four stockpiles, and two 4-point composites from a smaller stockpile, and one 4-point composite from smallest stockpile to the northeast. The sampling locations are shown on Figures 3 and 4. The stockpile samples were analyzed for CAM 17 metals (EPA Test Methods 6010/7471), OCPs (EPA Test Method 8081), semi-volatile organic compounds (EPA Test Method 8270 SIM), and NOA by plane light microscopy (PLM), CARB 435 1000-Point Count.

Stockpile sample collection activities were conducted as described in the general field procedures summarized in Appendix A.

### **2.2.2 Analytical Results**

The laboratory results of the pesticides analyses are summarized in Table 5, metals analyses are summarized in Table 6, petroleum hydrocarbon and semi-volatile compounds analyses are summarized in Table 3, and results of the PLM analyses are summarized in Table 7. Only those chemicals that exceeded detection limits in at least one sample are included in the summary tables. The complete laboratory results are included as Appendix B.

The organochlorine pesticide results show that all of the composite samples had detectable concentrations of 4,4'-DDD, 4,4'-DDE, and/or 4,4'-DDT that range from 0.0039 milligrams per kilogram (mg/Kg) up to 0.190 mg/Kg. These concentrations are well below their respective single compound California Human Health Screening Levels (CHHSL) (Cal/EPA, 2005) for residential uses. Alpha chlordane, technical chlordane, and gamma chlordane were also detected in two of the samples collected and concentrations were also well below their respective single compound CHHSL screening levels. Because chlordane was detected exceeding ¼ of the single compound CHHSL in composite sample SP-4-2, the discrete samples

from composite SP-4-2 were each analyzed to evaluate the chlordane concentration in each sample. None of the concentrations detected in the discrete samples exceeded their respective residential CHHSLs. Dieldrin was detected in one of the composite samples at 0.0037 mg/Kg. This concentration is below the single compound CHHSL of 0.035 mg/kg for residential uses.

Ten metals (arsenic, barium, chromium, cobalt, copper, lead, mercury, nickel, vanadium and zinc) had detectable concentrations from the composited samples collected from the stockpiles. Except for arsenic and mercury, the metals concentrations were below the CHHSL and total threshold limit concentration (T TLC) for hazardous waste classification in all soil samples analyzed. Concentrations of arsenic were detected exceeding laboratory detection limits in just two of the soil samples. Arsenic concentrations were detected in the samples ranging from 1.8 mg/Kg to 7.0 mg/Kg. The reported arsenic concentrations exceed the CHHSL for residential land use of 0.07 mg/Kg; however, naturally-occurring arsenic concentrations in this geographic area commonly exceed these screening criteria. Because of this, the recommended acceptable risk management guideline concentration for arsenic in the San Francisco Bay Region (Duverge', 2011) is 12 mg/Kg. None of the arsenic concentrations exceed 12 mg/Kg.

Mercury concentrations were detected in two of the composite samples (SP-6-1 and SP-6-2) exceeding  $\frac{1}{4}$  of the single compound CHHSL. The discrete samples were each therefore analyzed to determine possible elevated concentrations of mercury. The mercury concentrations detected in the discrete samples ranged from <0.5 mg/kg to 9.5 mg/kg with one concentration detected at 51 mg/kg. This mercury concentration exceeds the CHHSL of 18 mg/kg for residential uses and the hazardous waste threshold of 20 mg/Kg.

The other metals concentrations detected generally appear consistent with naturally-occurring concentrations in California (Scott, 1991).

Semi-volatile compounds were only detected in one of the composite samples collected from the stockpiles exceeding the laboratory reporting limits. Chrysene was detected in composite sample SP-2-1 at 0.043 mg/kg. There is no CHHSL established for this compound and therefore the results were compared to the San Francisco Regional Water Quality Control Board (SFRWQCB) Environmental Screening Levels (ESLs) for shallow soil for the protection of groundwater, gross contamination ceiling value (odors), and direct exposure (residential land use). The concentration detected in the soil samples did not exceed any of their respective ESLs.

Chrysotile fibers were detected exceeding the 0.10% detection limit in two of the nineteen cap soil samples analyzed by the PLM (CARB 435 1,000 Point Count) method. None of the concentrations detected exceed the BAAQMD limit of 0.25%.

---

## **3.0 SUMMARY AND CONCLUSIONS**

---

### **3.1 Previous Investigation**

#### **3.1.1 Mercury in Bedrock**

Extensive sampling and testing of ore vein rock was performed to evaluate mercury concentrations in this material. The testing results show that mercury concentrations exceed the California Human Health Screening Levels (CHHSLs) for residential use of 18 milligrams per kilogram (mg/kg) at only three locations, and none of the locations exceed the CHHSL for commercial and industrial uses. The hazardous waste threshold of 20 mg/kg was exceeded at two locations in the mine area, and at one location in the extreme northwest corner of the Site. The mercury testing results from the naturally-occurring outcrops were combined and a 95% Upper Confidence Limit (UCL) calculation was performed (Appendix C). The results show that the 95% UCL is 8.2 mg/kg which is well below the residential CHHSL and the hazardous waste concentration. Based on this analysis, the mercury in bedrock may not need to be mitigated.

#### **3.1.2 Former Ore Processing Area**

A former ore crusher and furnace was located near the former main mine portal. A number of borings were completed in the area after elevated mercury and nickel concentrations were identified in initial sampling of the area. The detected mercury contamination exceeded the CHHSLs for residential uses, but not commercial/industrial standards. The nickel concentrations were elevated but did not exceed either standard for direct exposure. Solubility testing showed that nickel from one sample exceeded the hazardous waste concentrations. Since residential development planned in this area, the soils with mercury exceeding residential standards should be excavated and removed from the Site. Based on the nickel results, the soils could require disposal as a hazardous waste. Stockpiling and resampling is recommended to evaluate concentrations prior to disposal.

#### **3.1.3 Petroleum Hydrocarbons in Fill**

Sampling was performed of fill soils in the lower, eastern area of the Site. Borehole drilling identified thin lenses (6 and 12 inches) of black, petroleum hydrocarbon material 3 to 6 feet below the surface in two areas. Comprehensive laboratory testing of this material identified only motor oil contamination. The concentrations exceeded the San Francisco

Regional Water Quality Control Board (SFRWQCB) thresholds for gross contamination (possible odors) for soils less than 3 meters deep, but not the updated direct exposure for construction workers (SFRWQCB, 2013).

### **3.1.4 Spring Water Sampling**

Two springs and the quarry pond at the Site were sampled six continuous quarters during the 2009 investigation. One of the springs emanates from the former main haul line portal for the mine, and the other spring is in an area north of the mine and it drains to the quarry pond. Water from inside the mine was also sampled. The sampling results were compared to the very restrictive RWQCB Environmental Screening Levels (ESLs) for surface water screening levels for estuary habitats because this water may be captured by sub drains installed for the future development and eventually be discharged to Coyote Creek and the San Francisco Bay. The only constituents identified at potentially elevated concentrations in the samples collected were arsenic, thallium, and nickel. These metals were most likely naturally occurring and related to the hydrothermally altered and/or ultramafic rocks at the Site. The SFRWQCB may require this water to be treated prior to discharge to storm drains. It is possible that this water may be discharged instead to the planned sanitary sewers under permit with the treatment facility.

### **3.1.5 Quarry Pond Sampling**

Water samples collected from the quarry pond identified methyl mercury concentrations that exceed the SFRWQCB ESLs for surface water screening levels for estuary habitats. Methyl mercury is soluble and is produced in water by sulfate reducing bacteria under low-oxygen conditions when elemental mercury is present in sufficient concentrations. The quarry pond is therefore capable of generating methyl mercury which likely occurs at depth in the pond during the summer months when algae depletes the deep portion of the pond of oxygen allowing anaerobic conditions to develop resulting in the production of methyl mercury. If the quarry pond water will be discharged off-site after development, measures should be taken to prevent release of elevated concentrations of methyl mercury. Likewise, any water storage planned for the new development should be designed to prevent low-oxygen conditions from developing.

### **3.1.6 Naturally-Occurring Asbestos**

Serpentinite bedrock containing chrysotile asbestos (NOA) is present over large areas of the Site, as shown on the geologic map produced for the geotechnical investigation (Cornerstone, 2009). Five samples were collected from locations distributed throughout the Site and analyzed for NOA. The samples were analyzed by plane light microscopy (PLM) and CARB 435 400 Point Count methods. NOA (as chrysotile) was detected in all five of the bedrock samples analyzed

by PLM. Due to the high percentage of fibers in four of the bedrock samples, accurate point counting could not be performed, and therefore an estimate of 20-30 percent NOA, as chrysotile, was reported for the four samples. The concentrations in all of these samples exceed the Bay Area Air Quality Management District (BAAQMD) limit of 0.25% (State of California, 2002) and therefore a Dust Mitigation Plan is required to be submitted and approved by the BAAQMD. The plan must describe dust control measures during grading as well as long term dust control measures.

Three additional soil samples were collected from different depths to determine the NOA concentrations at depth in fill and deep colluvium in the northern end of the Site west of the existing Quarry Pond. The samples were analyzed by transmitting electron microscopy (TEM) methods because this test is able to resolve the smaller asbestos fibers that are in soils. Laboratory analyses of deeper, buried colluvium soils in this area detected NOA concentrations of only 0.002 and 0.003 percent. These concentrations are less than the BAAQMD criteria of 0.25% and also the DTSC Schools Division criteria of 0.01%. These soils are therefore suitable for capping of NOA in the bedrock at the Site for any of the planned redevelopment areas. These soils are largely covered by fill soils that contained higher concentrations of NOA which would have to be removed if the deeper soils are to be reused for cover material.

### **3.2 Current Investigation**

The current investigation was performed to evaluate potential threats to human health and the environment from the quarry reclamation activities at the Site (capping) and the soil quality of several large stockpiles that remain on the lower portion of the Site. Additional soil sampling was performed to evaluate these concerns. Twenty potholes were completed in the areas where capping of exposed bedrock with soil was performed. Nineteen composite samples were collected from the six stockpiles located on the lower portion of the Site. No pesticides, petroleum range hydrocarbons, or semi-volatile organic compounds were detected during the sampling that exceeded the regulatory thresholds.

Lead was detected at only one cap sampling location (80 mg/kg) that equals the regulatory standards for residential use. Mercury was detected in only one discrete stockpile sample that exceeded the regulatory guidelines for residential use (18 mg/kg) and the TTLC for hazardous waste (20 mg/kg). The sampling that was performed does not characterize the lateral and vertical extent of soils affected with elevated concentrations of metals, but there will be extensive grading of the Site including moving and spreading the large stockpile and well as excavation and regrading of the area where the lead in the soil cap exceeds the regulatory standard. Therefore, the affected soils will be extensively mixed which will reduce concentrations and therefore we do not believe it is necessary to excavate and off-haul the soils.

Naturally-occurring asbestos in rock has been identified across the Site that exceeds the BAAQMD and DTSC Schools Program acceptable risk guidelines at most locations. The concentrations detected exceed the BAAQMD limit of 0.25% (State of California, 2002) and therefore a Dust Mitigation Plan will be required to be submitted and approved by the BAAQMD prior to the commencement of grading activities. The Plan must describe dust control measures during grading as well as long term dust control measures. The BAAQMD will likely require perimeter dust monitoring to confirm that the effective asbestos dust control measures are occurring. Long-term dust control measures allowed in the Asbestos Airborne Toxic Control Measure (ATCM) (State of California, 2002) include capping with at least 3 inches of non-NOA containing soils, paving, establishment of a vegetative cover, and other measures deemed sufficient to prevent visible dust emissions when wind speeds exceed 10 miles per hour. It should be noted that planned cut areas of exposed bedrock will not support vegetation and will need a thin soil cap. There are on-Site materials that can be used for this purpose (that does not contain NOA) though import soils may need to be imported if sufficient quantity is not present on Site.

In addition to Air Board regulations, there are CalOSHA worker safety criteria for asbestos that the grading contractor will need to be aware of as well as any other site personnel who could be working in the NOA areas where exposure could occur during construction activities. For these personnel there are training requirements that range up from a minimum of 3 hours of asbestos awareness training. The trade contractors should be notified of the CalOSHA worker safety requirements. Post-grading and during Site development, MCI recommends that all subsurface excavations in the areas with NOA be monitored to prevent uncontrolled release and spreading of NOA materials during and after excavation. NOA is difficult to dispose off-Site and therefore excavated NOA materials should be placed back in utility trenches, if possible, or placed as fill and covered elsewhere at the Site to avoid off-haul costs.

The DTSC Schools Program regulates new and expanding schools and will review the application for the planned school at the Site. The State of California DTSC Schools Program considers less than 0.01% asbestos sufficiently protective for schools use. The NOA underlying the school will require more extensive capping with hardscape or soils containing less than 0.01% NOA, and a long-term Operations and Maintenance Agreement with the school district to control releases of NOA in the future.

---

## **4.0 LIMITATIONS**

---

This report was prepared for the use of the KB Home for evaluating soil quality at the Site. The scope of work performed on this Site does not represent an exhaustive study, but rather a reasonable inquiry consistent with environmental principles generally accepted at this time and

location. We make no warranty, expressed or implied, except that our services have been performed in this manner. Additional environmental conditions may be present that are not reasonably ascertainable. The chemical and other data presented in this report can change over time and are applicable only to the time this study was performed. Changes in applicable standards can occur as the result of legislation or regulatory guidelines that may invalidate, wholly or in part, the findings of this report.

## **FIELD PROCEDURES**

This section describes the soil sampling field methods that were used to evaluate the potential environmental concerns described previously. Included is a description of the sampling equipment, the methods of sampling, and quality assurance and quality control (QA/QC) practices including equipment decontamination.

### **Collection of Soil Samples**

Soil samples were collected using a small track-mounted excavator. The excavator was used to dig a pothole through the soil caps and into the bedrock material, and to pothole into the stockpiles. Samples were then collected from the sidewalls of the potholes. If the excavation was too deep to enter, the samples were collected from the soil in the bucket of the excavator from the specified depth. Soil samples for OCPs, metals, Semi-VOC and total petroleum hydrocarbon testing were collected by hand from the pothole sidewalls and stockpile locations using new, disposable, laboratory supplied 4 ounce glass jars. After sample collection the Teflon lined lid was securely fastened on the jar and the jar was labeled with a unique sample identification number. New gloves were worn by the sampling personnel and were changed between sampling locations and discarded. The samples were then placed in an insulated cooler chilled to 4 degrees +/- 2 degrees Celsius and hand delivered by MCI personnel to a California-certified analytical laboratory.

Soil samples collected for asbestos testing were collected by hand from the reclamation soils and stockpile soils with a small trowel or pick and the samples were placed in new gallon-size freezer bag with a ziplock top. The non-dedicated sampling equipment (e.g., small trowel or pick) was decontaminated to prevent cross contamination of soil particles that may contain NOA fibers. The equipment was washed in distilled water and then double rinsed in distilled water to remove all soil particles. The sample bags were labeled with a unique sample identification number. The samples were then transported to a California-certified analytical laboratory. There is currently no California certification for NOA testing, but those samples were analyzed by Asbestos TEM Lab in Berkeley which is a nationally certified NIST/NVLAP laboratory.

## **DECONTAMINATION**

All equipment was decontaminated as follows:

- Rinse with high-pressure/hot water steam cleaner;
- Wash external surfaces of the hand sampling equipment with distilled water and Liquinox; scrub as necessary to remove dirt, grime, grease, and oil;
- Wash internal surfaces of equipment as described above;
- Rinse with high-pressure/hot water steam cleaner;
- Rinse with potable water; and,
- Air or towel dry with paper towels.

RE: LABORATORY REPORT #315101

Transmission electron microscopy analytical results for 1 bulk material sample(s).

Job Site: Comm Hill

Job No.:

Please find below the results for the TEM analysis of one or more bulk material samples. The analytical procedures were performed according to the EPA Test Method For the Determination of Asbestos in Bulk Building Materials - TEM method (EPA 600/R-93/116) modified for quantitative bulk soil sample analysis. Prior to analysis, each sample was logged-in and all pertinent data was recorded. Each sample was checked for damage and disruption of any chain-of-custody seals. A unique laboratory number was assigned to each sample. A hard copy Log-In sheet was generated. This, and all other relevant paper work was kept with the sample throughout the analytical procedures to assure proper analysis.

Sample preparation followed a standard CARB 435 prep method. The entire sample was dried at 135-150 C and then crushed to ~3/8" gravel size. If the submitted sample was >1 pint, the sample was split using a 1/2" riffle splitter following ASTM Method C-702-98 to obtain a 1 pint aliquot. The entire 1 pint aliquot, or entire original sample, was then pulverized in a Bico Braun disc pulverizer calibrated to produce a nominal 200 mesh final product. A representative ~100 mg aliquot of material was weighed out, and then placed into solution in a 500 ml beaker filled with distilled water. A known volume of the liquid suspension was filtered onto a 0.2 micron pore size Millipore mixed cellulose ester filter. The filter was then dried in HEPA filtered, Class 100 air on a clean bench. The filter was placed onto a glass microscope slide, sectioned, and collapsed in acetone. The collapsed filter was plasma-etched to remove 10% of the filter surface and then carbon coated. The carbon coated filter was sectioned and the sections placed onto 200-mesh copper TEM sample grids in dimethyl sulfoxide and acetone wick washers. After sufficient time to dissolve the filter material, the TEM sample grids were removed from the baths and placed into labeled sample containers.

TEM analysis was performed on a Philips CM-12 or JEOL 1200 transmission electron microscope operating at 80 or 100 kV. The sample was placed into the microscope where it was first scanned at low magnification to confirm that the distribution of material was reasonably homogeneous. High magnification analysis was performed using a two tier approach: 1) A relatively large area of several TEM grid openings for large asbestos fibers or fiber bundles, and 2) a relatively small area of a number of fields of view for individual asbestos fibers (fibrous particles exhibiting an aspect ratio greater than or equal to 3 to 1, and a length greater than or equal to .5 um). Detected asbestos structures were subjected to detailed morphological and/or selected area diffraction analysis. If necessary, energy dispersive X-ray analysis was also performed. The length and width of each asbestos fiber was measured. From this data, a total volume and mass of asbestos observed in the scanned area is calculated, and extrapolated to a total weight percent asbestos for each sample.

RE: LABORATORY JOB # 1340-00025  
Polarized light microscopy analytical results for 10 bulk sample(s).  
Job Site:  
Job No.: Comm Hill

Enclosed please find the bulk material analytical results for one or more samples submitted for asbestos analysis. The analyses were performed in accordance with the California Air Resources Board (ARB) Method 435 for the determination of asbestos in serpentine aggregate samples.

Prior to analysis, samples are logged-in and all data pertinent to the sample recorded. The samples are checked for damage or disruption of any chain-of-custody seals. A unique laboratory ID number is assigned to each sample. A hard copy log-in sheet containing all pertinent information concerning the sample is generated. This and all other relevant paper work are kept with the sample throughout the analytical procedures to assure proper analysis.

Sample preparation follows a standard CARB 435 prep method. The entire sample is dried at 135-150 C and then crushed to ~3/8" gravel size using a Bico Chipmunk crusher. If the submitted sample is >1 pint, the sample was split using a 1/2" riffle splitter following ASTM Method C-702-98 to obtain a 1 pint aliquot. The entire 1 pint aliquot, or entire original sample, is then pulverized in a Bico Braun disc pulverizer calibrated to produce a nominal 200 mesh final product. If necessary, additional homogenization steps are undertaken using a 3/8" riffle splitter. Small aliquots are collected from throughout the pulverized material to create three separate microscope slide mounts containing the appropriate refractive index oil. The prepared slides are placed under a polarizing light microscope where standard mineralogical techniques are used to analyze the various materials present, including asbestos. If asbestos is identified and of less than 10% concentration by visual area estimate then an additional five sample mounts are prepared. Quantification of asbestos concentration is obtained using the standard CAL ARB Method 435 point count protocol. For samples observed to contain visible asbestos of less than 10% concentration, a point counting technique is used with 50 points counted on each of eight sample mounts for a total of 400 points. The data is then compiled into standard report format and subjected to a thorough quality assurance check before the information is released to the client.

While the CARB 435 method has much to commend it, there are a number of situations where it fails to provide sufficient accuracy to make a definitive determination of the presence/absence of asbestos and/or an accurate count of the asbestos concentration present in a given sample. These problems include, but are not limited to, 1) statistical uncertainty with samples containing <1% asbestos when too few particles are counted, 2) definitive identification and discrimination between various fibrous amphibole minerals such as tremolite/actinolite/hornblende and the "Libby amphiboles" such as tremolite/winchite/richterite/arfvedsonite, and C) small asbestiform fibers which are near or below the resolution limit of the PLM microscope such as those found in various California coast range serpentine bodies. In these cases, further analysis by transmission electron microscopy is recommended to obtain a more accurate result.

Sincerely Yours,  
*T. McCloskey*

RE: LABORATORY JOB # 1340-00023

Polarized light microscopy analytical results for 11 bulk sample(s).

Job Site:

Job No.: Comm Hill

Enclosed please find the bulk material analytical results for one or more samples submitted for asbestos analysis. The analyses were performed in accordance with the California Air Resources Board (ARB) Method 435 for the determination of asbestos in serpentine aggregate samples.

Prior to analysis, samples are logged-in and all data pertinent to the sample recorded. The samples are checked for damage or disruption of any chain-of-custody seals. A unique laboratory ID number is assigned to each sample. A hard copy log-in sheet containing all pertinent information concerning the sample is generated. This and all other relevant paper work are kept with the sample throughout the analytical procedures to assure proper analysis.

Sample preparation follows a standard CARB 435 prep method. The entire sample is dried at 135-150 C and then crushed to ~3/8" gravel size using a Bico Chipmunk crusher. If the submitted sample is >1 pint, the sample was split using a 1/2" riffle splitter following ASTM Method C-702-98 to obtain a 1 pint aliquot. The entire 1 pint aliquot, or entire original sample, is then pulverized in a Bico Braun disc pulverizer calibrated to produce a nominal 200 mesh final product. If necessary, additional homogenization steps are undertaken using a 3/8" riffle splitter. Small aliquots are collected from throughout the pulverized material to create three separate microscope slide mounts containing the appropriate refractive index oil. The prepared slides are placed under a polarizing light microscope where standard mineralogical techniques are used to analyze the various materials present, including asbestos. If asbestos is identified and of less than 10% concentration by visual area estimate then an additional five sample mounts are prepared. Quantification of asbestos concentration is obtained using the standard CAL ARB Method 435 point count protocol. For samples observed to contain visible asbestos of less than 10% concentration, a point counting technique is used with 50 points counted on each of eight sample mounts for a total of 400 points. The data is then compiled into standard report format and subjected to a thorough quality assurance check before the information is released to the client.

While the CARB 435 method has much to commend it, there are a number of situations where it fails to provide sufficient accuracy to make a definitive determination of the presence/absence of asbestos and/or an accurate count of the asbestos concentration present in a given sample. These problems include, but are not limited to, 1) statistical uncertainty with samples containing <1% asbestos when too few particles are counted, 2) definitive identification and discrimination between various fibrous amphibole minerals such as tremolite/actinolite/hornblende and the "Libby amphiboles" such as tremolite/winchite/richterite/arfvedsonite, and C) small asbestos fibers which are near or below the resolution limit of the PLM microscope such as those found in various California coast range serpentine bodies. In these cases, further analysis by transmission electron microscopy is recommended to obtain a more accurate result.

Sincerely Yours,

Lab Manager  
ASBESTOS TEM LABORATORIES, INC.

RE: LABORATORY JOB # 1340-00026  
Polarized light microscopy analytical results for 5 bulk sample(s).  
Job Site:  
Job No.: Comm Hill

Enclosed please find the bulk material analytical results for one or more samples submitted for asbestos analysis. The analyses were performed in accordance with the California Air Resources Board (ARB) Method 435 for the determination of asbestos in serpentine aggregate samples.

Prior to analysis, samples are logged-in and all data pertinent to the sample recorded. The samples are checked for damage or disruption of any chain-of-custody seals. A unique laboratory ID number is assigned to each sample. A hard copy log-in sheet containing all pertinent information concerning the sample is generated. This and all other relevant paper work are kept with the sample throughout the analytical procedures to assure proper analysis.

Sample preparation follows a standard CARB 435 prep method. The entire sample is dried at 135-150 C and then crushed to ~3/8" gravel size using a Bico Chipmunk crusher. If the submitted sample is >1 pint, the sample was split using a 1/2" riffle splitter following ASTM Method C-702-98 to obtain a 1 pint aliquot. The entire 1 pint aliquot, or entire original sample, is then pulverized in a Bico Braun disc pulverizer calibrated to produce a nominal 200 mesh final product. If necessary, additional homogenization steps are undertaken using a 3/8" riffle splitter. Small aliquots are collected from throughout the pulverized material to create three separate microscope slide mounts containing the appropriate refractive index oil. The prepared slides are placed under a polarizing light microscope where standard mineralogical techniques are used to analyze the various materials present, including asbestos. If asbestos is identified and of less than 10% concentration by visual area estimate then an additional five sample mounts are prepared. Quantification of asbestos concentration is obtained using the standard CAL ARB Method 435 point count protocol. For samples observed to contain visible asbestos of less than 10% concentration, a point counting technique is used with 50 points counted on each of eight sample mounts for a total of 400 points. The data is then compiled into standard report format and subjected to a thorough quality assurance check before the information is released to the client.

While the CARB 435 method has much to commend it, there are a number of situations where it fails to provide sufficient accuracy to make a definitive determination of the presence/absence of asbestos and/or an accurate count of the asbestos concentration present in a given sample. These problems include, but are not limited to, 1) statistical uncertainty with samples containing <1% asbestos when too few particles are counted, 2) definitive identification and discrimination between various fibrous amphibole minerals such as tremolite/actinolite/hornblende and the "Libby amphiboles" such as tremolite/winchite/richterite/arfvedsonite, and C) small asbestiform fibers which are near or below the resolution limit of the PLM microscope such as those found in various California coast range serpentine bodies. In these cases, further analysis by transmission electron microscopy is recommended to obtain a more accurate result.

Sincerely Yours,

RE: Comm Hill

Work Order No.: 1301058

Dear Tom McCloskey:

Torrent Laboratory, Inc. received 16 sample(s) on January 09, 2013 for the analyses presented in the following Report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991. If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

---

## Laboratory Qualifiers and Definitions

### DEFINITIONS:

<b>Accuracy/Bias (% Recovery)</b> - The closeness of agreement between an observed value and an accepted reference value.
<b>Blank (Method/Preparation Blank)</b> -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.
<b>Duplicate</b> - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)
<b>Laboratory Control Sample (LCS ad LCSD)</b> - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.
<b>Matrix</b> - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)
<b>Matrix Spike (MS/MSD)</b> - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.
<b>Method Detection Limit (MDL)</b> - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero
<b>Practical Quantitation Limit (PQL)</b> - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.
<b>Precision (%RPD)</b> - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates
<b>Surrogate (S) or (Surr)</b> - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis
<b>Tentatively Identified Compound (TIC)</b> - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.
<b>Units:</b> the unit of measure used to express the reported result - <b>mg/L</b> and <b>mg/Kg</b> (equivalent to PPM - parts per million in <b>liquid</b> and <b>solid</b> ), <b>ug/L</b> and <b>ug/Kg</b> (equivalent to PPB - parts per billion in <b>liquid</b> and <b>solid</b> ), <b>ug/m3</b> , <b>mg.m3</b> , <b>ppbv</b> and <b>ppmv</b> (all units of measure for reporting concentrations in air), % (equivalent to 10000 ppm or 1,000,000 ppb), <b>ug/Wipe</b> (concentration found on the surface of a single Wipe usually taken over a 100cm <sup>2</sup> surface)

### LABORATORY QUALIFIERS:

<b>B</b> - Indicates when the analyte is found in the associated method or preparation blank
<b>D</b> - Surrogate is not recoverable due to the necessary dilution of the sample
<b>E</b> - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
<b>H</b> - Indicates that the recommended holding time for the analyte or compound has been exceeded
<b>J</b> - Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather than quantitative
<b>NA</b> - Not Analyzed
<b>N/A</b> - Not Applicable
<b>NR</b> - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
<b>R</b> - The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
<b>S</b> - Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
<b>X</b> -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

## Sample Receipt Checklist

Client Name: McCloskey Consultants

Date and Time Received: 1/9/2013 15:46

Project Name: Comm Hill

Received By: ng

Work Order No.: 1301058

Physically Logged By: ng

Checklist Completed By: ng

Carrier Name: Client Drop Off

### Chain of Custody (COC) Information

Chain of custody present? Yes

Chain of custody signed when relinquished and received? Yes

Chain of custody agrees with sample labels? Yes

Custody seals intact on sample bottles? Not Present

### Sample Receipt Information

Custody seals intact on shipping container/coolер? Not Present

Shipping Container/Cooler In Good Condition? Yes

Samples in proper container/bottle? Yes

Samples containers intact? Yes

Sufficient sample volume for indicated test? Yes

### Sample Preservation and Hold Time (HT) Information

All samples received within holding time? Yes

Container/Temp Blank temperature in compliance? Yes Temperature: 2 °C

Water-VOA vials have zero headspace? No VOA vials submitted

Water-pH acceptable upon receipt? N/A

pH Checked by: n/a pH Adjusted by: n/a

RE: Comm Hill

Work Order No.: 1301067 Rev: 1

Dear Tom McCloskey:

Torrent Laboratory, Inc. received 20 sample(s) on January 11, 2013 for the analyses presented in the following Report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991. If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

A handwritten signature in blue ink, appearing to read "Janice Winn-Shilling".

**Work Order:** 1301067

### CASE NARRATIVE

---

No issues encountered with the receiving, preparation, analysis or reporting of the results associated with this work order.

Unless otherwise indicated in the following narrative, no results have been method and/or field blank corrected.

Reported results relate only to the items/samples tested by the laboratory.

Analytical Comments for method 8270SIM, MS/MSD, Note: The % recoveries are outside of laboratory control limits but % RPD is within limits. The associated LCS/LCSD is within both % Recovery and %RPD limits. No corrective action required.

#### REVISIONS:

Report revised to include Hg on 4 samples per client request.

Rev 1 (02/11/13)

## MS/MSD Summary Report

*Raw values are used in quality control assessment.*

Work Order:	1301067	Prep Method:	3545_PAHSIM	Prep Date:	01/16/13	Prep Batch:	7587
Matrix:	Soil	Analytical Method:	SW8270C	Analyzed Date:	01/16/13	Analytical Batch:	413483
Spiked Sample:	1301067-015A						
Units:	mg/Kg						

Parameters	MDL	PQL	Sample Conc.	Spike Conc.	MS % Recovery	MSD % Recovery	MS/MSD % RPD	% Recovery Limits	% RPD Limits	Lab Qualifier
Acenaphthene	0.4220	2.48	0	0.25	15.8	1.60	1.26	11.9 - 106	30	S
Pyrene	0.6200	2.48	0	0.25	9.40	9.60	2.11	16.9 - 136	30	S
2-Fluorobiphenyl (S)				5	25.2	25.4		25 - 91.6		
p-Terphenyl-d14 (S)				5	46.4	44.0		24.3 - 129		

## Laboratory Qualifiers and Definitions

### DEFINITIONS:

<b>Accuracy/Bias (% Recovery)</b> - The closeness of agreement between an observed value and an accepted reference value.
<b>Blank (Method/Preparation Blank)</b> -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.
<b>Duplicate</b> - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)
<b>Laboratory Control Sample (LCS ad LCSD)</b> - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.
<b>Matrix</b> - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)
<b>Matrix Spike (MS/MSD)</b> - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.
<b>Method Detection Limit (MDL)</b> - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero
<b>Practical Quantitation Limit (PQL)</b> - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.
<b>Precision (%RPD)</b> - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates
<b>Surrogate (S) or (Surr)</b> - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis
<b>Tentatively Identified Compound (TIC)</b> - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.
<b>Units:</b> the unit of measure used to express the reported result - <b>mg/L</b> and <b>mg/Kg</b> (equivalent to PPM - parts per million in <b>liquid</b> and <b>solid</b> ), <b>ug/L</b> and <b>ug/Kg</b> (equivalent to PPB - parts per billion in <b>liquid</b> and <b>solid</b> ), <b>ug/m3</b> , <b>mg.m3</b> , <b>ppbv</b> and <b>ppmv</b> (all units of measure for reporting concentrations in air), % ( equivalent to 10000 ppm or 1,000,000 ppb), <b>ug/Wipe</b> (concentration found on the surface of a single Wipe usually taken over a 100cm <sup>2</sup> surface)

### LABORATORY QUALIFIERS:

<b>B</b> - Indicates when the analyte is found in the associated method or preparation blank
<b>D</b> - Surrogate is not recoverable due to the necessary dilution of the sample
<b>E</b> - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
<b>H</b> - Indicates that the recommended holding time for the analyte or compound has been exceeded
<b>J</b> - Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather than quantitative
<b>NA</b> - Not Analyzed
<b>N/A</b> - Not Applicable
<b>NR</b> - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
<b>R</b> - The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
<b>S</b> - Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
<b>X</b> -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

## Sample Receipt Checklist

Client Name: McCloskey Consultants

Date and Time Received: 1/11/2013 10:44

Project Name: Comm Hill

Received By: rk

Work Order No.: 1301067

Physically Logged By: ng

Checklist Completed By: ng

Carrier Name: Client Drop Off

### Chain of Custody (COC) Information

Chain of custody present? Yes

Chain of custody signed when relinquished and received? Yes

Chain of custody agrees with sample labels? Yes

Custody seals intact on sample bottles? Not Present

### Sample Receipt Information

Custody seals intact on shipping container/cooler? Not Present

Shipping Container/Cooler In Good Condition? Yes

Samples in proper container/bottle? Yes

Samples containers intact? Yes

Sufficient sample volume for indicated test? Yes

### Sample Preservation and Hold Time (HT) Information

All samples received within holding time? Yes

Container/Temp Blank temperature in compliance? Yes Temperature: 2 °C

Water-VOA vials have zero headspace? No VOA vials submitted

Water-pH acceptable upon receipt? N/A

pH Checked by: n/a pH Adjusted by: n/a

Dear PM Team,

We need to analyze the discrete samples for SP-6-1 in WO 1301067

SP-6-1A  
SP-6-1B  
SP-6-1C  
SP-6-1D

The samples need analyzed for Mercury on a 5 Day TAT.

Thank you.

Sincerely,

Christopher Vertin

RE: Comm Hill

Work Order No.: 1301146

Dear Tom McCloskey:

Torrent Laboratory, Inc. received 7 sample(s) on January 21, 2013 for the analyses presented in the following Report.

Seven samples received and two placed on hold per CoC instructions.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991. If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

A handwritten signature in blue ink that appears to read "Patti Sandrock".

### CASE NARRATIVE

---

No issues encountered with the receiving, preparation, analysis or reporting of the results associated with this work order.

Unless otherwise indicated in the following narrative, no results have been method and/or field blank corrected.

Reported results relate only to the items/samples tested by the laboratory.

Analytical Comments for method 6010B 1301146-001 MS/MSD, Note:The % recoveries for Chromium are outside of laboratory control limits but % RPD is within limits. The associated LCS/LCSD is within both % Recovery and %RPD limits. No corrective action required.

The spikes in the MS/MSD for Nickel are not recoverable. The sample concentration is greater than 4X the spike concentration. No corrective action is required.

Analytical Comments for method S\_7471B 1301146-006 MS/MSD, Note:The % recoveries for Mercury are outside of laboratory control limits but % RPD is within limits. The associated LCS/LCSD is within both % Recovery and %RPD limits. No corrective action required.

## Laboratory Qualifiers and Definitions

### DEFINITIONS:

<b>Accuracy/Bias (% Recovery)</b> - The closeness of agreement between an observed value and an accepted reference value.
<b>Blank (Method/Preparation Blank)</b> -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.
<b>Duplicate</b> - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)
<b>Laboratory Control Sample (LCS ad LCSD)</b> - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.
<b>Matrix</b> - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)
<b>Matrix Spike (MS/MSD)</b> - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.
<b>Method Detection Limit (MDL)</b> - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero
<b>Practical Quantitation Limit (PQL)</b> - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.
<b>Precision (%RPD)</b> - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates
<b>Surrogate (S) or (Surr)</b> - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis
<b>Tentatively Identified Compound (TIC)</b> - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.
<b>Units:</b> the unit of measure used to express the reported result - <b>mg/L</b> and <b>mg/Kg</b> (equivalent to PPM - parts per million in <b>liquid</b> and <b>solid</b> ), <b>ug/L</b> and <b>ug/Kg</b> (equivalent to PPB - parts per billion in <b>liquid</b> and <b>solid</b> ), <b>ug/m3</b> , <b>mg.m3</b> , <b>ppbv</b> and <b>ppmv</b> (all units of measure for reporting concentrations in air), % ( equivalent to 10000 ppm or 1,000,000 ppb), <b>ug/Wipe</b> (concentration found on the surface of a single Wipe usually taken over a 100cm <sup>2</sup> surface)

### LABORATORY QUALIFIERS:

<b>B</b> - Indicates when the analyte is found in the associated method or preparation blank
<b>D</b> - Surrogate is not recoverable due to the necessary dilution of the sample
<b>E</b> - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
<b>H</b> - Indicates that the recommended holding time for the analyte or compound has been exceeded
<b>J</b> - Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather than quantitative
<b>NA</b> - Not Analyzed
<b>N/A</b> - Not Applicable
<b>NR</b> - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
<b>R</b> - The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
<b>S</b> - Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
<b>X</b> -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

## Sample Receipt Checklist

Client Name: McCloskey Consultants

Date and Time Received: 1/21/2013 15:47

Project Name: Comm Hill

Received By: ng

Work Order No.: 1301146

Physically Logged By: Iorna

Checklist Completed By: Iorna

Carrier Name: Torrent Courier

### Chain of Custody (COC) Information

Chain of custody present? Yes

Chain of custody signed when relinquished and received? Yes

Chain of custody agrees with sample labels? Yes

Custody seals intact on sample bottles? Not Present

### Sample Receipt Information

Custody seals intact on shipping container/cooler? Not Present

Shipping Container/Cooler In Good Condition? Yes

Samples in proper container/bottle? Yes

Samples containers intact? Yes

Sufficient sample volume for indicated test? Yes

### Sample Preservation and Hold Time (HT) Information

All samples received within holding time? Yes

Container/Temp Blank temperature in compliance? Yes Temperature: 3 °C

Water-VOA vials have zero headspace? No VOA vials submitted

Water-pH acceptable upon receipt? N/A

pH Checked by: n/a pH Adjusted by: n/a

RE: Comm Hill

Work Order No.: 1301147 Rev: 1

Dear Tom McCloskey:

Torrent Laboratory, Inc. received 12 sample(s) on January 21, 2013 for the analyses presented in the following Report.

Samples received and composited

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991. If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

A handwritten signature in blue ink, appearing to read "Janice Winn-Shilling".

---

**Client:** McCloskey Consultants

**Project:** Comm Hill

**Work Order:** 1301147

## CASE NARRATIVE

---

No issues encountered with the receiving, preparation, analysis or reporting of the results associated with this work order.

Unless otherwise indicated in the following narrative, no results have been method and/or field blank corrected.

Reported results relate only to the items/samples tested by the laboratory.

### REVISIONS:

Report revised to include Hg on 4 samples.

Rev 1 (2/11/13)

## Laboratory Qualifiers and Definitions

### DEFINITIONS:

<b>Accuracy/Bias (% Recovery)</b> - The closeness of agreement between an observed value and an accepted reference value.
<b>Blank (Method/Preparation Blank)</b> -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.
<b>Duplicate</b> - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)
<b>Laboratory Control Sample (LCS ad LCSD)</b> - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.
<b>Matrix</b> - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)
<b>Matrix Spike (MS/MSD)</b> - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.
<b>Method Detection Limit (MDL)</b> - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero
<b>Practical Quantitation Limit (PQL)</b> - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.
<b>Precision (%RPD)</b> - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates
<b>Surrogate (S) or (Surr)</b> - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis
<b>Tentatively Identified Compound (TIC)</b> - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.
<b>Units:</b> the unit of measure used to express the reported result - <b>mg/L</b> and <b>mg/Kg</b> (equivalent to PPM - parts per million in <b>liquid</b> and <b>solid</b> ), <b>ug/L</b> and <b>ug/Kg</b> (equivalent to PPB - parts per billion in <b>liquid</b> and <b>solid</b> ), <b>ug/m3</b> , <b>mg.m3</b> , <b>ppbv</b> and <b>ppmv</b> (all units of measure for reporting concentrations in air), % ( equivalent to 10000 ppm or 1,000,000 ppb), <b>ug/Wipe</b> (concentration found on the surface of a single Wipe usually taken over a 100cm <sup>2</sup> surface)

### LABORATORY QUALIFIERS:

<b>B</b> - Indicates when the analyte is found in the associated method or preparation blank
<b>D</b> - Surrogate is not recoverable due to the necessary dilution of the sample
<b>E</b> - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
<b>H</b> - Indicates that the recommended holding time for the analyte or compound has been exceeded
<b>J</b> - Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather than quantitative
<b>NA</b> - Not Analyzed
<b>N/A</b> - Not Applicable
<b>NR</b> - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
<b>R</b> - The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
<b>S</b> - Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
<b>X</b> -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

## Sample Receipt Checklist

Client Name: McCloskey Consultants

Date and Time Received: 1/21/2013 15:47

Project Name: Comm Hill

Received By: ng

Work Order No.: 1301147

Physically Logged By: Iorna

Checklist Completed By: Iorna

Carrier Name: Torrent Courier

### Chain of Custody (COC) Information

Chain of custody present? Yes

Chain of custody signed when relinquished and received? Yes

Chain of custody agrees with sample labels? Yes

Custody seals intact on sample bottles? Not Present

### Sample Receipt Information

Custody seals intact on shipping container/cooler? Not Present

Shipping Container/Cooler In Good Condition? Yes

Samples in proper container/bottle? Yes

Samples containers intact? Yes

Sufficient sample volume for indicated test? Yes

### Sample Preservation and Hold Time (HT) Information

All samples received within holding time? Yes

Container/Temp Blank temperature in compliance? Yes Temperature: 3 °C

Water-VOA vials have zero headspace? No VOA vials submitted

Water-pH acceptable upon receipt? N/A

pH Checked by: n/a pH Adjusted by: n/a

Dear PM Team,

We need to analyze the discrete samples for SP-6-2 in WO 1301147

SP-6-2A  
SP-6-2B  
SP-6-2C  
SP-6-2D

The samples need analyzed for Mercury on a 5 Day TAT

Thank you.

Sincerely,

Christopher Vertin

RE: Comm Hill

Work Order No.: 1301060

Dear Tom McCloskey:

Torrent Laboratory, Inc. received 12 sample(s) on January 09, 2013 for the analyses presented in the following Report.

Fifteen samples received and composited 4:1 per CoC instructions.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991. If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

### CASE NARRATIVE

---

No issues encountered with the receiving, preparation, analysis or reporting of the results associated with this work order.

Unless otherwise indicated in the following narrative, no results have been method and/or field blank corrected.

Reported results relate only to the items/samples tested by the laboratory.

## Laboratory Qualifiers and Definitions

### DEFINITIONS:

<b>Accuracy/Bias (% Recovery)</b> - The closeness of agreement between an observed value and an accepted reference value.
<b>Blank (Method/Preparation Blank)</b> -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.
<b>Duplicate</b> - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)
<b>Laboratory Control Sample (LCS ad LCSD)</b> - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.
<b>Matrix</b> - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)
<b>Matrix Spike (MS/MSD)</b> - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.
<b>Method Detection Limit (MDL)</b> - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero
<b>Practical Quantitation Limit (PQL)</b> - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.
<b>Precision (%RPD)</b> - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates
<b>Surrogate (S) or (Surr)</b> - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis
<b>Tentatively Identified Compound (TIC)</b> - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.
<b>Units:</b> the unit of measure used to express the reported result - <b>mg/L</b> and <b>mg/Kg</b> (equivalent to PPM - parts per million in <b>liquid</b> and <b>solid</b> ), <b>ug/L</b> and <b>ug/Kg</b> (equivalent to PPB - parts per billion in <b>liquid</b> and <b>solid</b> ), <b>ug/m3</b> , <b>mg.m3</b> , <b>ppbv</b> and <b>ppmv</b> (all units of measure for reporting concentrations in air), % (equivalent to 10000 ppm or 1,000,000 ppb), <b>ug/Wipe</b> (concentration found on the surface of a single Wipe usually taken over a 100cm <sup>2</sup> surface)

### LABORATORY QUALIFIERS:

<b>B</b> - Indicates when the analyte is found in the associated method or preparation blank
<b>D</b> - Surrogate is not recoverable due to the necessary dilution of the sample
<b>E</b> - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
<b>H</b> - Indicates that the recommended holding time for the analyte or compound has been exceeded
<b>J</b> - Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather than quantitative
<b>NA</b> - Not Analyzed
<b>N/A</b> - Not Applicable
<b>NR</b> - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
<b>R</b> - The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
<b>S</b> - Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
<b>X</b> -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

### Chain of Custody (COC) Information

Chain of custody present? Yes

Chain of custody signed when relinquished and received? Yes

Chain of custody agrees with sample labels? Yes

Custody seals intact on sample bottles? Not Present

### Sample Receipt Information

Custody seals intact on shipping container/coolер? Not Present

Shipping Container/Cooler In Good Condition? Yes

Samples in proper container/bottle? Yes

Samples containers intact? Yes

Sufficient sample volume for indicated test? Yes

### Sample Preservation and Hold Time (HT) Information

All samples received within holding time? Yes

Container/Temp Blank temperature in compliance? Yes Temperature: 2 °C

Water-VOA vials have zero headspace? No VOA vials submitted

Water-pH acceptable upon receipt? N/A

pH Checked by: n/a pH Adjusted by: n/a

RE: Comm Hill

Work Order No.: 1301061

Dear Tom McCloskey:

Torrent Laboratory, Inc. received 16 sample(s) on January 09, 2013 for the analyses presented in the following Report.

Twenty samples received and composited 4:1 per CoC instructions.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991. If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

### CASE NARRATIVE

---

No issues encountered with the receiving, preparation, analysis or reporting of the results associated with this work order.

Unless otherwise indicated in the following narrative, no results have been method and/or field blank corrected.

Reported results relate only to the items/samples tested by the laboratory.

## MS/MSD Summary Report

*Raw values are used in quality control assessment.*

Work Order:	1301061	Prep Method:	3545_PAHSIM	Prep Date:	01/10/13	Prep Batch:	7544
Matrix:	Soil	Analytical Method:	SW8270C	Analyzed Date:	01/10/13	Analytical Batch:	413393
Spiked Sample:	1301061-010A						
Units:	mg/Kg						

Parameters	MDL	PQL	Sample Conc.	Spike Conc.	MS % Recovery	MSD % Recovery	MS/MSD % RPD	% Recovery Limits	% RPD Limits	Lab Qualifier
Acenaphthene	0.04220	0.248	0	0.25	94.2	18.1	4.07	11.9 - 106	30	
Pyrene	0.06200	0.248	0.0721	0.25	119	117	2.19	16.9 - 136	30	
2-Fluorobiphenyl (S)				5	85.8	76.9		25 - 91.6		
p-Terphenyl-d14 (S)				12	54.4	56.1		24.3 - 129		

## Laboratory Qualifiers and Definitions

### DEFINITIONS:

<b>Accuracy/Bias (% Recovery)</b> - The closeness of agreement between an observed value and an accepted reference value.
<b>Blank (Method/Preparation Blank)</b> -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.
<b>Duplicate</b> - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)
<b>Laboratory Control Sample (LCS ad LCSD)</b> - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.
<b>Matrix</b> - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)
<b>Matrix Spike (MS/MSD)</b> - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.
<b>Method Detection Limit (MDL)</b> - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero
<b>Practical Quantitation Limit (PQL)</b> - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.
<b>Precision (%RPD)</b> - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates
<b>Surrogate (S) or (Surr)</b> - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis
<b>Tentatively Identified Compound (TIC)</b> - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.
<b>Units:</b> the unit of measure used to express the reported result - <b>mg/L</b> and <b>mg/Kg</b> (equivalent to PPM - parts per million in <b>liquid</b> and <b>solid</b> ), <b>ug/L</b> and <b>ug/Kg</b> (equivalent to PPB - parts per billion in <b>liquid</b> and <b>solid</b> ), <b>ug/m3</b> , <b>mg.m3</b> , <b>ppbv</b> and <b>ppmv</b> (all units of measure for reporting concentrations in air), % (equivalent to 10000 ppm or 1,000,000 ppb), <b>ug/Wipe</b> (concentration found on the surface of a single Wipe usually taken over a 100cm <sup>2</sup> surface)

### LABORATORY QUALIFIERS:

<b>B</b> - Indicates when the analyte is found in the associated method or preparation blank
<b>D</b> - Surrogate is not recoverable due to the necessary dilution of the sample
<b>E</b> - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
<b>H</b> - Indicates that the recommended holding time for the analyte or compound has been exceeded
<b>J</b> - Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather than quantitative
<b>NA</b> - Not Analyzed
<b>N/A</b> - Not Applicable
<b>NR</b> - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
<b>R</b> - The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
<b>S</b> - Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
<b>X</b> -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

## Sample Receipt Checklist

Client Name: McCloskey Consultants

Date and Time Received: 1/9/2013 15:46

Project Name: Comm Hill

Received By: ng

Work Order No.: 1301061

Physically Logged By: ng

Checklist Completed By: ng

Carrier Name: Client Drop Off

### Chain of Custody (COC) Information

Chain of custody present? Yes

Chain of custody signed when relinquished and received? Yes

Chain of custody agrees with sample labels? Yes

Custody seals intact on sample bottles? Not Present

### Sample Receipt Information

Custody seals intact on shipping container/coolер? Not Present

Shipping Container/Cooler In Good Condition? Yes

Samples in proper container/bottle? Yes

Samples containers intact? Yes

Sufficient sample volume for indicated test? Yes

### Sample Preservation and Hold Time (HT) Information

All samples received within holding time? Yes

Container/Temp Blank temperature in compliance? Yes Temperature: 2 °C

Water-VOA vials have zero headspace? No VOA vials submitted

Water-pH acceptable upon receipt? N/A

pH Checked by: n/a pH Adjusted by: n/a

RE: Comm Hill

Work Order No.: 1301144

Dear Tom McCloskey:

Torrent Laboratory, Inc. received 20 sample(s) on January 21, 2013 for the analyses presented in the following Report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991. If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

---

Janice Winn-Shilling  
Sr. Project Manager

January 28, 2013

---

Date

**Date:** 1/28/2013

---

**Client:** McCloskey Consultants

**Project:** Comm Hill

**Work Order:** 1301144

### CASE NARRATIVE

---

No issues encountered with the receiving, preparation, analysis or reporting of the results associated with this work order.

Unless otherwise indicated in the following narrative, no results have been method and/or field blank corrected.

Reported results relate only to the items/samples tested by the laboratory.

---

Analytical Comments for method SW6010B, 1301144-001A MS/MSD, QC Analytical Batch ID 413636,  
Note: The % recoveries for

Barium are outside of laboratory control limits but % RPD is within limits. The associated LCS/LCSD is within both % Recovery and %RPD limits. No corrective action required.

## Laboratory Qualifiers and Definitions

### DEFINITIONS:

<b>Accuracy/Bias (% Recovery)</b> - The closeness of agreement between an observed value and an accepted reference value.
<b>Blank (Method/Preparation Blank)</b> -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.
<b>Duplicate</b> - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)
<b>Laboratory Control Sample (LCS ad LCSD)</b> - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.
<b>Matrix</b> - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)
<b>Matrix Spike (MS/MSD)</b> - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.
<b>Method Detection Limit (MDL)</b> - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero
<b>Practical Quantitation Limit (PQL)</b> - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.
<b>Precision (%RPD)</b> - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates
<b>Surrogate (S) or (Surr)</b> - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis
<b>Tentatively Identified Compound (TIC)</b> - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.
<b>Units:</b> the unit of measure used to express the reported result - <b>mg/L</b> and <b>mg/Kg</b> (equivalent to PPM - parts per million in <b>liquid</b> and <b>solid</b> ), <b>ug/L</b> and <b>ug/Kg</b> (equivalent to PPB - parts per billion in <b>liquid</b> and <b>solid</b> ), <b>ug/m3</b> , <b>mg.m3</b> , <b>ppbv</b> and <b>ppmv</b> (all units of measure for reporting concentrations in air), % (equivalent to 10000 ppm or 1,000,000 ppb), <b>ug/Wipe</b> (concentration found on the surface of a single Wipe usually taken over a 100cm <sup>2</sup> surface)

### LABORATORY QUALIFIERS:

<b>B</b> - Indicates when the analyte is found in the associated method or preparation blank
<b>D</b> - Surrogate is not recoverable due to the necessary dilution of the sample
<b>E</b> - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
<b>H</b> - Indicates that the recommended holding time for the analyte or compound has been exceeded
<b>J</b> - Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather than quantitative
<b>NA</b> - Not Analyzed
<b>N/A</b> - Not Applicable
<b>NR</b> - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
<b>R</b> - The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
<b>S</b> - Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
<b>X</b> -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

## Sample Receipt Checklist

Client Name: McCloskey Consultants

Date and Time Received: 1/21/2013 15:47

Project Name: Comm Hill

Received By: ng

Work Order No.: 1301144

Physically Logged By: lorna

Checklist Completed By: lorna

Carrier Name: Torrent Courier

### Chain of Custody (COC) Information

Chain of custody present? Yes

Chain of custody signed when relinquished and received? Yes

Chain of custody agrees with sample labels? Yes

Custody seals intact on sample bottles? Not Present

### Sample Receipt Information

Custody seals intact on shipping container/coolер? Not Present

Shipping Container/Cooler In Good Condition? Yes

Samples in proper container/bottle? Yes

Samples containers intact? Yes

Sufficient sample volume for indicated test? Yes

### Sample Preservation and Hold Time (HT) Information

All samples received within holding time? Yes

Container/Temp Blank temperature in compliance? Yes Temperature: 3 °C

Water-VOA vials have zero headspace? No VOA vials submitted

Water-pH acceptable upon receipt? N/A

pH Checked by: n/a pH Adjusted by: n/a

## **Appendix C**

### **Mercury 95% Upper Confidence Limit Results**

# Communication Hill Mercury 95% UCL Calc for Bedrock Material

## CALCULATION OF UPPER CONFIDENCE LIMITS

Enter t distribution value from the chart to the right for the appropriate number of samples and for the desired Upper Confidence Level percentage.

Sample Concentrations	t distribution value:	1.697
0.093	<b>Number of Samples:</b>	32
22.9	<b>Mean:</b>	5.24
15.4	<b>Variance:</b>	98.65
10.7	<b>Standard Deviation:</b>	9.93
2.9	<b>Standard Error:</b>	1.76
2.3		
0.83	<b>Upper Limit of Confidence Interval:</b>	8.22
0.77		
20.9		
0.27	<b>Regulatory Threshold:</b>	18.00
0.6		
0.16	<b>Appropriate Number of Samples to Collect From a Solid Waste:</b>	1.74
12		
5.6		
2.1		
7.3	Notes: Per EPA SW846 it is typical to use 90% for haz waste evaluation. Either 90 or 95 is used for health risk evaluations.	
0.58		
4		
0.36	It is assumed that the data is normally distributed. A graph of detection frequency (y-axis) vs. concentration (x-axis) should be prepared for confirmation	
48		
0.05		
0.58	One half of the detection limit should be used for non-detect samples	
7.2		
1.2	Calculation for number of samples only applies if threshold is > mean	
0.15		
0.05		
0.05		
0.26		
0.05		
0.11		
0.05		
0.05		

Number of Samples	t values for 90% Probability	t values for 95% Probability
