PRIORITIZATON AND COSTS OF REHABILITATION AND REPLACEMENT PROJECTS

1.0 INTRODUCTION

The purpose of this project memorandum (PM) is to confirm the prioritization and implementation timing for annual investments needed for the rehabilitation and replacement (R&R) assets/projects that were identified for the City of San José's City Capital Improvement Plan (CIP) for the San José/Santa Clara Water Pollution Control Plant (WPCP). The list of R&R assets/projects presented in this PM is based on previous studies conducted for the City; namely, the Infrastructure Condition Assessment (ICA) Report by CH2M Hill (May 2007), the WPCP Process Piping Assessment (PPA) Report by CH2M Hill (February 2008), and the Headworks Condition Assessment (HCA) Technical Memorandum by Carollo Engineers (Revised Draft, July 2009). These reports present previous findings and recommendations for R&R assets/projects, prioritization, and estimated costs. Based on the initial findings of this work, the City has developed a five year, \$200 million R&R CIP, which will be reviewed and confirmed as part of this PM.

This PM is the second in a series of three asset management PMs developed as part of the San José/Santa Clara Water Pollution Control Plant Master Plan (Master Plan). The first in this series is PM 4.4 Existing Asset Management Practices Description, and the third is PM 4.6 Asset Management Program Implementation Needs.

2.0 BACKGROUND

2.1 Previous Reports

2.1.1 <u>Infrastructure Condition Assessment Report, May 2007, CH2M Hill</u>

The City commissioned CH2M Hill to conduct a condition assessment of the WPCP infrastructure and to identify the capital improvement projects needed to maintain the City's wastewater service for its existing customers. This report provided background information on the WPCP and the R&R norms and benchmarking in the industry. It developed a listing and description of the major facilities (assets) by process area, their condition, and potential improvements. Some assets were directly translated into projects, while others were combined into projects (i.e., Miscellaneous Support). However, no documentation exists to explain which assets were combined into projects, so there are simply numerous assets with no assigned project. Cost estimates to complete the improvements necessary for each project were provided, and a risk score was developed in order to prioritize them. The risk score included factors such as the probability of failure, including condition and redundancy, trigger factors, such as obsolescence, and the consequence of failure, including service

reliability, as well as health and safety of employees and the public. These factors were combined mathematically to produce a risk score that was ranked from highest to lowest. The risk ranking was the parameter on which project prioritization was based. Using the prioritization, an overall CIP and a suggested five (5) year CIP was developed. A final report was issued to the City in May 2007 which identified the capital investments needed to address the existing infrastructure at the WPCP.

This PM incorporates the identification of assets/projects, the development of cost estimates, and the prioritization methodology that were developed in the ICA Report as the basis for the development of the implementation timing and the annual R&R investments needed to fund the implementation schedule.

2.1.2 WPCP Process Piping Assessment, February 2008, CH2M Hill

As follow-on work to the development of the ICA Report, CH2M Hill was tasked with assessing the condition of the process piping at the WPCP. A database of process piping and valves was developed, and condition was assessed for each asset. A risk score was assigned for each asset using a very similar methodology to the one employed in the ICA Report. The risk scores were ranked from highest to lowest, and this ranking was the basis for prioritization. The recommendation of the PPA Report, which was completed in February 2008, was for the City to conduct more detailed condition assessments on the process piping and valves. This work is currently underway and will be undertaken by City staff.

Since no specific recommendations or cost estimates were developed for the R&R of the process piping, results from this report are not incorporated into this PM.

2.1.3 <u>Headworks Condition Assessment Technical Memorandum, Revised Draft,</u> <u>July 2009, Carollo Engineers</u>

Carollo Engineers developed the Draft HCA Technical Memorandum (TM) for the City in April and July 2009. The purpose of this TM was to evaluate and recommend a cost effective long-term solution for WPCP headworks operation by considering two options: (1) phased improvements to Headworks 1 and continue to operate in parallel with Headworks 2 or (2) expansion of Headworks 2 to handle all flows to the WPCP. Condition, original useful life, remaining service life, and current replacement value was evaluated for each asset. An analysis comparing the two alternatives was presented.

The ICA Report identified a New Headworks and Wet Weather Facility project that, based on the results of the HCA TM and discussions with City staff, was modified in this PM to be named the Headworks Upgrade project. The estimated cost from the ICA Report was updated in this PM, in order to be more conservative, with the higher of the two cost estimates from the HCA TM.

3.0 METHODOLOGY

3.1 Assets/Projects

The list of assets/projects that are presented in this PM were taken directly from the ICA Report, with the exception of the name modification from New Headworks and Wet Weather Facility project to Headworks Upgrade project. As discussed previously, no information from the PPA Report is included in this PM, as that report did not develop specific R&R recommendations.

The ICA Report identified 85 assets that were organized by twelve different process areas. This list is shown in Appendix A. These assets were categorized into 70 projects. This list is shown in Appendix B. Some assets, such as the Machine Shop, were not directly assigned to projects. Some projects were not linked with any specific assets, such as Civil Infrastructure. For these cases, there is no documentation linking assets and projects. Some assumptions can be made with respect to relating assets and projects. For the purposes of this PM, the 70 projects that were developed in the ICA Report will be used directly, rather than disaggregating the projects without assets or matching assets without projects. Assets without projects are shown in this PM, but do not have costs associated with them, and therefore are shown for informational purposes only. The assets/projects that were identified in the ICA Report have not been further verified or investigated as part of this PM.

3.2 **Risk**

The ICA Report provided an assessment for each asset/project that resulted in a risk score (except the Headworks Upgrade, Miscellaneous Support, and Civil Infrastructure projects). The assessment was divided into three categories - consequence, probability, and trigger. Each category was comprised of various factors, each with a unique weighting between 0 and 1 and a score. The scores are shown in Table 1. Weightings were assigned to each factor, and a score for each factor was assigned to each asset/project.

Table 1	Assessment Scores San José/Santa Clara Water Po City of San José	ollution Control Plant Master Plan
	Description ⁽¹⁾	Score ⁽¹⁾
	Negligible	1
	Minor	2
	Moderate	4
	Major	7
	Critical	10
Notes:		
(1) Infras	tructure Condition Assessment Report	by CH2M Hill, May 2007.

Six consequence factors were considered: service reliability, compliance with regulations and permits, health and safety of employees and public, ability to return asset to level of service, financial impact, and disruption to the community/public image. Four probability factors were utilized: condition assessment overall, effective operating protocols, reliability, and planned redundancy. Three trigger factors were used: capacity and utilization, obsolescence, and maintenance requirements.

The factors were mathematically combined to produce a relative risk score for each asset/project using the following equation:

Relative Risk Score = $\sum (W_C \times S_C) \times [\sum (W_P \times S_P) + \sum (W_T \times S_T)]$

Where:

W_C = Weight of Consequence Factor

 S_C = Score of Consequence Factor

W_P = Weight of Probability Factor

 $S_P = Score of Probability Factor$

 W_T = Weight of Trigger Factor

 S_T = Score of Trigger Factor

The risk scores varied between 0 and 402. The risk scores for each asset/project are shown in Appendix C. The asset/project risk scores were sorted to produce a risk ranking. Risk rankings ranged from 1 to 84. A risk ranking was assigned to the Civil Infrastructure project even though a risk assessment and score were not developed. The assessment, scores, and ranking that were presented in the ICA Report have not been further verified or investigated as part of this PM.

3.3 Costs

The ICA Report developed total capital cost estimates for each project. These costs included a variety of factors that are shown in Table 2. The factors include an escalation to mid-point of construction of 48.3 percent. In order to forecast annual R&R investments as part of this PM, the mid-point of construction escalation cost component was subtracted from the total capital cost estimate to provide unescalated total capital project cost. The final ICA Report was completed in May 2007, so it was assumed that the costs were in May 2007 dollars. Using the Engineering News Record Construction Cost Index (ENRCCI), an ENRCCI of 7942 was used for May 2007. An ENRCCI of 8534 was used for March 2009. In order to escalate the unescalated total capital project costs to current dollars, the ratio of the two ENRCCI values was applied to the unescalated total capital project costs to update the costs to March 2009 dollars.

- (1) Infrastructure Condition Assessment Report by CH2M Hill, May 2007, Table 16-1.
- (2) Factor applied to unadjusted cost estimate in a compounded fashion.
- (3) Factor applied to Escalated Construction Cost.

The HCA TM developed two cost estimates for the Headworks Upgrade project, for rehabilitating Headworks 1 or expanding Headworks 2 in March 2009 dollars. In order to be conservative, the higher of the two cost estimates was used as part of this PM in lieu of the estimate that was developed in the ICA Report. Brown and Caldwell is concurrently performing engineering work on all the digesters, and reviewed the unescalated total capital project costs (in March 2009 dollars) for the digesters. It was determined that the costs are adequate as planning level cost estimates. The unescalated total capital project costs are the costs that are used in the following sections of this PM. Total capital costs and unescalated total capital project costs in March 2009 dollars are shown in Appendix D.

The cost estimates presented in the ICA Report have not been further verified or investigated as part of this PM, except for the costs associated with the digester and the Headworks Upgrade projects. Prior to implementation of any of the projects, a more detailed examination of cost estimates is recommended.

3.4 Prioritization

In order to develop an implementation schedule and an annual R&R investment forecast, the projects need to be prioritized since not all projects can be implemented at the same time. In order to prioritize the projects in a logical and explainable way, a methodology was required.

3.4.1 Parameters

There are numerous parameters that can be used to prioritize assets/projects. Parameters that are often used include risk, criticality, condition, remaining useful life, and repair or replacement costs.

3.4.2 **Prioritization**

The ICA Report prioritized the assets/projects based on the risk score. Assets/projects were ranked from highest risk score to lowest risk score. The asset/project with the highest risk ranking was given the highest priority. Using this prioritization method, projects were selected for the suggested five (5) year CIP.

In some cases, projects with much lower risk rankings were included in the suggested five (5) year CIP based on the professional judgment of City staff. The inclusion of the low ranked projects in the suggested five (5) year CIP is inconsistent with the prioritization methodology, and to date, no documentation exists to explain the inclusion of these low priority projects. As part of the development of this PM, City staff has provided explanations for the inclusion of the projects in the suggested five (5) year CIP. The risk ranking for each project, along with a notation as to whether it was included in the ICA Report suggested five (5) year CIP and/or whether it was included in the City's actual CIP Fiscal Year 2009-2013, are shown in Appendix E. The majority of the suggested five (5) year ICA Report projects were included in the City's actual CIP Fiscal Year 2009-2013.

After discussions with City staff on May 4, 2009, it was decided that this PM would use the prioritization of projects as shown in Appendix E.

4.0 REPAIR AND REPLACEMENT FORECASTING

In order to forecast the annual investments required to implement the identified R&R assets/projects and compare that forecast to the City's current five (5) year \$200 million R&R CIP, a specific implementation time frame was evaluated. A variety of time frames including 20, 30 and 40 years was discussed with City staff on May 4, 2009. Based on this meeting, it was decided that an implementation time frame of 20 years would be used.

Assets/projects were distributed over the 20 time frame in order of their priority, which was based on the risk rank, such that the assets/projects with the highest priority were implemented first (e.g., in the earliest years of the 20 year time frame) and those with the

lowest priority were implemented last (e.g., in the last year of the 20 year time frame). The assets that were not assigned a project directly were ranked below the projects based on their risk score, from highest to lowest. Since most assets/projects will require more than one year to implement, costs were distributed over the duration of the project based on an S curve as shown in Appendix F. Best professional judgment was used to determine the project duration for each asset/project.

The unescalated total capital project costs were escalated throughout the 20 year time frame using an escalation factor of 4 percent. This escalation factor was determined by best professional judgment based on current market and economic conditions. The escalated costs were leveled throughout the 20 year period in order to allow the City to plan on investing approximately the same amount on R&R assets/projects per year, rather than having large fluctuations that could potentially make financing the projects complex.

Figure 1 shows the total average annual R&R investment in five year increments over the 20 year time frame in 2009 dollars. Figure 2 shows the total average annual R&R investment in five year increments over the 20 year time frame in future or escalated dollars. Figure 3 shows the total annual R&R investment per year in future or escalated dollars over the 20 year time frame.

Appendix G lists each asset/project, its priority, the year the asset/project starts, the project duration, the years the asset/project is online, the unescalated capital project cost (2009 dollars), the escalated capital project cost in each year for each asset/project, and the total escalated capital project cost for each year.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the data presented in Figure 2, the City needs to allocate on the order of \$50 +/-million dollars a year for R&R improvements over the next 20 years. This is consistent with the City's actual R&R CIP Fiscal Year 2009-2013 of \$202 million dollars at approximately \$40 million dollars of investment a year. A final CIP that includes the R&R assets/projects will be developed as a final deliverable as part of the Master Plan. The assets/projects discussed in this PM will be updated as the Master Plan moves forward as it is likely that some of the identified assets/projects may removed from the R&R list in their entirety if certain treatment processes are to be eliminated in the future. Other assets/projects may be incorporated into process upgrades and be accounted for elsewhere in the final CIP. In addition, the R&R assets/projects shown may be reprioritized as a result of ongoing Master Plan efforts. It is recommended that the list of R&R assets/projects be reviewed annually as part of the CIP planning process.

- (1) Infrastructure Condition Assessment Report by CH2M Hill, May 2007, Table 16-2. May 2007 dollars. Includes 48.3% mid-point escalation component.
- (2) 48.3% mid-point escalation component removed. Prorated to March 2009 dollars.
- (3) Name modified per discussions with City staff.
- (4) Cost to address this project assumed to be included in the Headworks Upgrade project.

Project Memorandum No. 5 APPENDIX E - PROJECT PRIORITIZATION

APPENDIX E - PROJECT PRIORITIZATION

Table E1 **Project Prioritization** San José/Santa Clara Water Pollution Control Plant Master Plan City of San José

Asset/Project ⁽¹⁾	Risk Ranking ⁽¹⁾	Included in Recommended 5 Year CIP ⁽¹⁾	Included in Actual 5 Year CIP ⁽²⁾	Cost Included in Actual 5 Year CIP ⁽²⁾	Remarks ⁽²⁾
Site Power Distribution (Medium and High Voltage)	1	Yes	Yes	See remarks	\$61.35M has been allocated in the 5-Year CIP for projects related to Electrical Reliability Improvements. Improvement needs for this asset will be addressed as part of that work.
Electrical Sub- Station M1-M2	2	Yes	Yes	See remarks	\$61.35M has been allocated in the 5-Year CIP for projects related to Electrical Reliability Improvements. Improvement needs for this asset will be addressed as part of that work.
Digester Gas System	3	Yes	Yes	\$10.3M	
Electrical Sub- Station 1	4	Yes	Yes	See remarks	\$61.35M has been allocated in the 5-Year CIP for projects related to Electrical Reliability Improvements. Improvement needs for this asset will be addressed as part of that work.
Electrical Sub- Station 2	5	Yes	Yes	See remarks	\$61.35M has been allocated in the 5-Year CIP for projects related to Electrical Reliability Improvements. Improvement needs for this asset will be addressed as part of that work.
Yard Piping	6	Yes	Yes	\$17.25M	
Outfall Channel	7	No	No	-	

Project Prioritization
San José/Santa Clara Water Pollution Control Plant Master Plan Table E1 City of San José

Asset/Project ⁽¹⁾	Risk Ranking ⁽¹⁾	Included in Recommended 5 Year CIP ⁽¹⁾	Included in Actual 5 Year CIP ⁽²⁾	Cost Included in Actual 5 Year CIP ⁽²⁾	Remarks ⁽²⁾
Digesters 1-3	8	Yes	Yes	See remarks	\$43.5M has been allocated in the 5-year CIP for overall digester rehabilitation. Improvement needs for this asset will be addressed as part of that work.
Digesters 12-16	9	Yes	Yes	See remarks	\$43.5M has been allocated in the 5-year CIP for overall digester rehabilitation. Improvement needs for this asset will be addressed as part of that work.
Digester 4	10	Yes	Yes	See remarks	\$43.5M has been allocated in the 5-year CIP for overall digester rehabilitation. Improvement needs for this asset will be addressed as part of that work.
Digesters 5-6	11	Yes	Yes	See remarks	\$43.5M has been allocated in the 5-year CIP for overall digester rehabilitation. Improvement needs for this asset will be addressed as part of that work.
Digesters 7-8	12	Yes	Yes	See remarks	\$43.5M has been allocated in the 5-year CIP for overall digester rehabilitation. Improvement needs for this asset will be addressed as part of that work.
Digesters 9-11	13	Yes	Yes	See remarks	\$43.5M has been allocated in the 5-year CIP for overall digester rehabilitation. Improvement needs for this asset will be addressed as part of that work.
Digester Sludge Export Station	14	Yes	No	-	On hold pending completion of the Plant Master Plan
Filtration Influent Pump Building	15	No	No	-	
P&E Building - Raw Sewage Pump Station	16	Yes	No	-	The raw sewage pumps have been rebuilt over the years and there are currently no plans in the next five years to replace the pumps.

Project Prioritization
San José/Santa Clara Water Pollution Control Plant Master Plan Table E1 City of San José

		Included in	Included in	Cost Included	
Asset/Project ⁽¹⁾	Risk Ranking ⁽¹⁾	Recommended 5 Year CIP ⁽¹⁾	Actual 5 Year CIP ⁽²⁾	in Actual 5 Year CIP ⁽²⁾	Remarks ⁽²⁾
Rail Spur Unloading	17	No	No	-	
Primary Effluent Pump Station	18	No	No	-	
Lagoons 28-59	19	No	No	-	
Secondary Blower Building	20	Yes	Yes	See remarks	Actual 5-year CIP includes projects to replace MCCs H and J (part of the \$61.35M budget for Electrical Reliability Improvements). Some of the improvements were included in this year's CIP (FY08/09). This includes a feasibility study to replace the existing air plenum, replacement of a waste heat recovery boiler, and field investigation on the condition of the existing engine foundations.
Headworks Upgrade	21	No	Yes	\$4.5M	Enhancement to the new Headworks to allow for independent operation of the new Headworks.
Detritors	22	No	No	-	
Drying Beds	23	Yes	No	-	On hold pending completion of the Plant Master Plan
Filtration Treatment	24	Yes	Yes	\$15.6M	Actual 5-year CIP includes projects to replace the filter influent, drain, surface wash, and backwash valves that are leaking and to replace the filter media and filter drain tiles.
Aerated Grit Chambers	25	No	No	-	
Chlorine Contact Tanks	26	No	No	-	

Project Prioritization
