**RE:** Hummingbird Energy Storage Project – San Jose, CA

**SUBJECT:** Air Quality Impacts Job#19-020

This memo addresses air pollutant and greenhouse gas emissions associated with construction and operation of the Hummingbird Energy Storage Project. The project proposes a 75 MW/300 MWh battery energy storage system within an existing R&D/manufacturing building located in a larger industrial/office park to be located in the southern part of the City of San Jose.

## **Project Description**

### Storage Building and Substation

The approximately 103,894-square foot, single-story building would house lithium ion batteries, racking/cabinets, and collection boxes. In addition to the batteries, inverters and medium voltage transformers would be installed inside the existing building. An approximately 15,000-square foot fenced area substation, located in the existing rear parking area behind the building, would be included. This substation is required to transform the electricity as required by PG&E and similar to other electrical substations

### Gen Tie Line

As part of the proposed project, approximately 2.5 miles of 115 kV transmission line running from the substation to the Pacific Gas & Electric (PG&E) Metcalf Natural Gas Generating Station substation would be installed. The transmission line would be underground along the east side of Monterey Road until the existing PG&E transmission line corridor that traverses Coyote Creek

and connects to the Metcalf Power Plant substation. An overhead transmission line that crosses Coyote Creek, with two steel poles, would also be constructed.

## Construction Activity

Construction of the Project, including tenant improvements within the existing building and construction of both the Project substation and gen-tie line, would occur in one contiguous phase starting in or around 2020. Total construction is anticipated to last 6 months with overlapping phases that include:

- Overhead Transmission. The transmission line will have two steel poles that are 90 to 100 feet high and include a total of 5 “wires”. The overhead construction will involve various foundation and line construction pieces of equipment; excavator with auger, excavator with bucket, rubber tired backhoe, loader, line trucks, reel truck, dump truck, pickup trucks, trailers, crane for setting the poles. An average of 7 pieces of construction equipment and no more than 12 at a time would be used. Duration from excavation to completion of conductor would be one month.
- Underground Transmission Line. This would include 2.5 miles of trenching and some micro-tunneling. The underground construction will have an excavator, Integrated Tool Carrier/Loader, rubber tire loader, dump trucks, broom, water truck, pickups, trailers, directional boring machine, jack and bore machine, motor grader, paving machine, rollers. An average of 12 pieces of construction equipment and no more than 18 at a time would be used. Total duration will be about 6-months.
- Substation. The substation construction duration is 5-months with similar type of equipment as the overhead construction.

A worksheet that includes construction assumptions was developed based on the types of construction and the information provided above. That information was input to the CalEEMod model to predict construction emissions. The construction assumptions and CalEEMod modeling output are provided in Attachment 1. Construction period emissions are summarized in Table 1.

**TABLE 1 Construction Period Emissions**

Scenario	ROG	NOx	PM <sub>10</sub> Exhaust	PM <sub>2.5</sub> Exhaust	CO2e
Total construction emissions (tons)					
Transmission Line, Substation and Building Renovation	0.26 tons	2.49 tons	0.11 tons	0.11 tons	395 Mtons
Average daily emissions (pounds) <sup>2</sup>	4 lbs.	38 lbs.	2 lbs.	2 lbs.	--
BAAQMD Thresholds (pounds per day)	54 lbs.	54 lbs.	82 lbs.	54 lbs.	--
<b>Exceed Threshold?</b>	<b>No</b>	<b>No</b>	<b>No</b>	<b>No</b>	<b>No</b>

Notes: <sup>1</sup> ROG = reactive organic gases, NOx = nitrogen oxides, PM<sub>10</sub> = coarse particulate matter or particulates with an aerodynamic diameter of 10 micrometers ( $\mu\text{m}$ ) or less, PM<sub>2.5</sub> = fine particulate matter or particulates with an aerodynamic diameter of 2.5 $\mu\text{m}$  or less.

<sup>2</sup> Assumes 6 months or 132 workdays.

The project construction activity is expected to have less-than-significant impacts in terms of construction impacts associated with exposure of sensitive receptors to toxic air contaminants (TACs) and fine particulate matter (PM<sub>2.5</sub>). Much of the construction activity associated with substation construction and building rehabilitation would not occur near sensitive receptors. Construction activities near sensitive receptors include placement of the transmission line, which is expected to be temporary activities at any one location. The total construction period is expected to be 6 months with activities near any sensitive receptor (i.e., residences along Monterey Road) lasting for much shorter periods.

Construction activities, particularly during site preparation and grading, would temporarily generate fugitive dust in the form of PM<sub>10</sub> and PM<sub>2.5</sub>. Sources of fugitive dust would include disturbed soils at the construction site and trucks carrying uncovered loads of soils. Unless properly controlled, vehicles leaving the site would deposit mud on local streets, which could be an additional source of airborne dust after it dries. The BAAQMD CEQA Air Quality Guidelines consider these impacts to be less than significant if best management practices are implemented to reduce these emissions. To avoid significant construction-period impacts, the project should include the following measures:

During any construction period ground disturbance, the applicant shall ensure that the project contractor implement measures to control dust and exhaust. Implementation of the measures recommended by BAAQMD and listed below would reduce the air quality impacts associated with grading and new construction to a less than significant level. The contractor shall implement the following best management practices that are required of all projects:

1. All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day.
2. All haul trucks transporting soil, sand, or other loose material off-site shall be covered.
3. All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited.
4. All vehicle speeds on unpaved roads shall be limited to 15 miles per hour (mph).
5. All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used.
6. Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California airborne toxics control measure Title 13, Section 2485 of California Code of Regulations [CCR]). Clear signage shall be provided for construction workers at all access points.

7. All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation.
8. Post a publicly visible sign with the telephone number and person to contact at the Lead Agency regarding dust complaints. This person shall respond and take corrective action within 48 hours. The Air District's phone number shall also be visible to ensure compliance with applicable regulations.

## **Operation**

The Project would utilize an existing R&D building to in a larger industrial/office park. The Project would be remotely monitored throughout the day and night. No permanent full-time or part-time employees would occupy the building. Direct emissions of air pollutants or GHG are not anticipated. There would be a small amount of emissions associated with weekly travel to the site and electricity usage. Emissions of air pollutants or their precursors and GHG would be minor and well below any significance thresholds.
